1 Introduction

1.1 Instrument description

The instrument **882 Compact IC plus – Cation** is one of the model versions of the 882 Compact IC plus line of instruments manufactured by the Metrohm Company. The 882 Compact IC plus line of instruments is distinguished by:

- the **intelligence** of its components, which are able to monitor and optimize all functions and to provide documentation according to FDA requirements.
- its **compact style of construction.**
- its **transparency**. All components are easily accessible and arranged in a clear manner.
- its **safety**. Chemicals and electronics are separated and a leak sensor is integrated in the wet end.
- its **environmental compatibility.**
- its **low noise emission.**

The instrument is operated with **MagIC Net™** software. It is connected via a USB connection to a PC on which MagIC Net™ is installed. The software automatically recognizes the instrument and checks its functional readiness. MagIC Net™ controls and monitors the instrument, evaluates the measured data and administers it in a database. The operation of MagIC Net™ is described in the online help or in the tutorial for MagIC Net™.

The instrument contains the following components:

High pressure pump

The intelligent and low pulsation high pressure pump pumps the eluent through the system. It is equipped with a chip on which its technical specifications and "life history" (operating hours, service data, …) are saved.

Inline filter

Inline filters protect the separation column securely against possible contamination from the eluent. Inline filters can however also just as well be used for the purpose of protecting other sensitive components against contaminations in the solutions used. The filter platelets with a pore size of 2 µm can be replaced quickly and easily. They remove particles like e. g. bacteria and algae from the solutions.

Pulsation absorber

The pulsation absorber protects the separation column from damage caused by pressure fluctuations when switching the injection valve, and reduces interfering pulsations during highly sensitive measurements.

Injection valve

The injection valve connects the eluent and sample path through rapid and precise valve switchover. A precisely measured amount of sample solution is injected and rinsed with eluent onto the separation column.

Separation column

The intelligent separation column is the heart of the ion chromatographic analysis. It separates the different components corresponding to their interactions with the column. Metrohm separation columns are equipped with a chip on which their technical specifications and their history (first use / setting up, operating hours, injections, …) are saved.

1.2 Intended use

The **882 Compact IC plus – Cation** is used for the ion chromatographic determination of cations or anions (without chemical suppression).

This instrument is suitable for processing chemicals and flammable samples. The usage of the 882 Compact IC plus – Cation therefore requires that the user has basic knowledge and experience in the handling of toxic and caustic substances. Knowledge with respect to the application of the fire prevention measures prescribed for laboratories is also mandatory.

1.3 About the documentation

1.3.1 Symbols and conventions

The following symbols and styles are used in this documentation:

*(5-**12**)*	**Cross-reference to figure legend** The first number refers to the figure number, the second to the instrument part in the figure.
1	**Instruction step** Carry out these steps in the sequence shown.
	**Warning** This symbol draws attention to a possible life hazard or risk of injury.

	**Warning** This symbol draws attention to a possible hazard due to electrical current.
	**Warning** This symbol draws attention to a possible hazard due to heat or hot instrument parts.
	**Warning** This symbol draws attention to a possible biological hazard.
	**Caution** This symbol draws attention to a possible damage of instruments or instrument parts.
	**Note** This symbol marks additional information and tips.

1.4 Safety instructions

1.4.1 General notes on safety

Warning

This instrument may only be operated in accordance with the specifications in this documentation.

This instrument has left the factory in a flawless state in terms of technical safety. To maintain this state and ensure non-hazardous operation of the instrument, the following instructions must be observed carefully.

1.4.2 Electrical safety

The electrical safety when working with the instrument is ensured as part of the international standard IEC 61010.

Warning

Only personnel qualified by Metrohm are authorized to carry out service work on electronic components.

Warning

Never open the housing of the instrument. The instrument could be damaged by this. There is also a risk of serious injury if live components are touched.

There are no parts inside the housing which can be serviced or replaced by the user.

Mains voltage

Warning

An incorrect mains voltage can damage the instrument.

Only operate this instrument with a mains voltage specified for it (see rear panel of the instrument).

Protection against electrostatic charges

Warning

Electronic components are sensitive to electrostatic charges and can be destroyed by discharges.

Always pull the mains cable out of the mains connection socket before connecting or disconnecting electrical appliances on the rear panel of the instrument.

1.4.3 Tubing and capillary connections

Caution

Leaks in tubing and capillary connections are a safety risk. Tighten all connections well by hand. Avoid applying excessive force to tubing connections. Damaged tubing ends lead to leakage. Appropriate tools can be used to loosen connections.

Check the connections regularly for leakage. If the instrument is used mainly in unattended operation, then weekly inspections are mandatory.

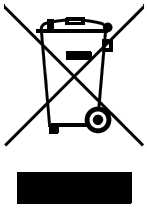
1.4.4 Flammable solvents and chemicals

Warning

All relevant safety measures are to be observed when working with flammable solvents and chemicals.

- Set up the instrument in a well-ventilated location (e.g. laboratory flue).
- Keep all sources of flame far from the workplace.
- Clean up spilled fluids and solids immediately.
- Follow the safety instructions of the chemical manufacturer.

1.4.5 Recycling and disposal



This product is covered by European Directive 2002/96/EC, WEEE – Waste from Electrical and Electronic Equipment.

The correct disposal of your old equipment will help to prevent negative effects on the environment and public health.

More details about the disposal of your old equipment can be obtained from your local authorities, from waste disposal companies or from your local dealer.

2 Overview of the instrument

2.1 Front

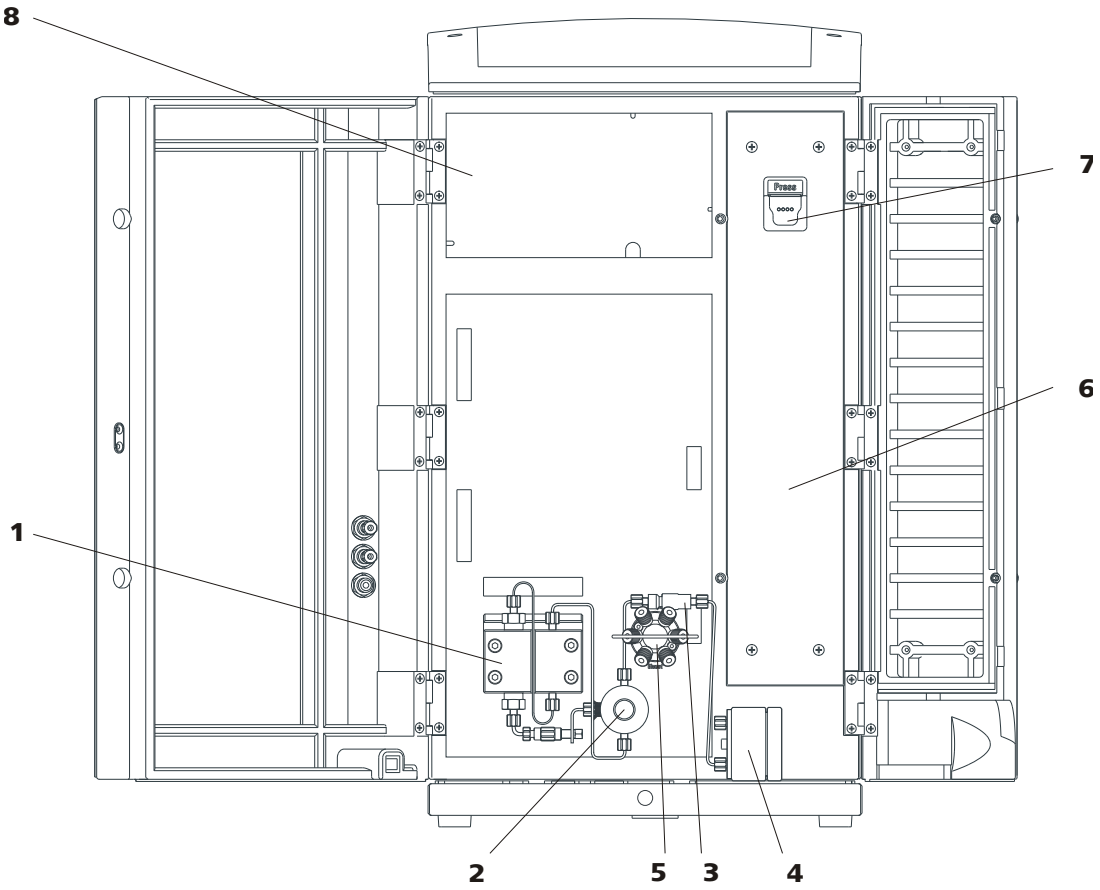


Figure 1 Front 882 Compact IC plus – Cation

3	**Inline filter**	**4**	**Pulsation absorber**
5	**Injection valve**	**6**	**Column chamber**
7	**Column holder** With column recognition.	**8**	**Detector chamber** Space for the detector.

2.2 Rear

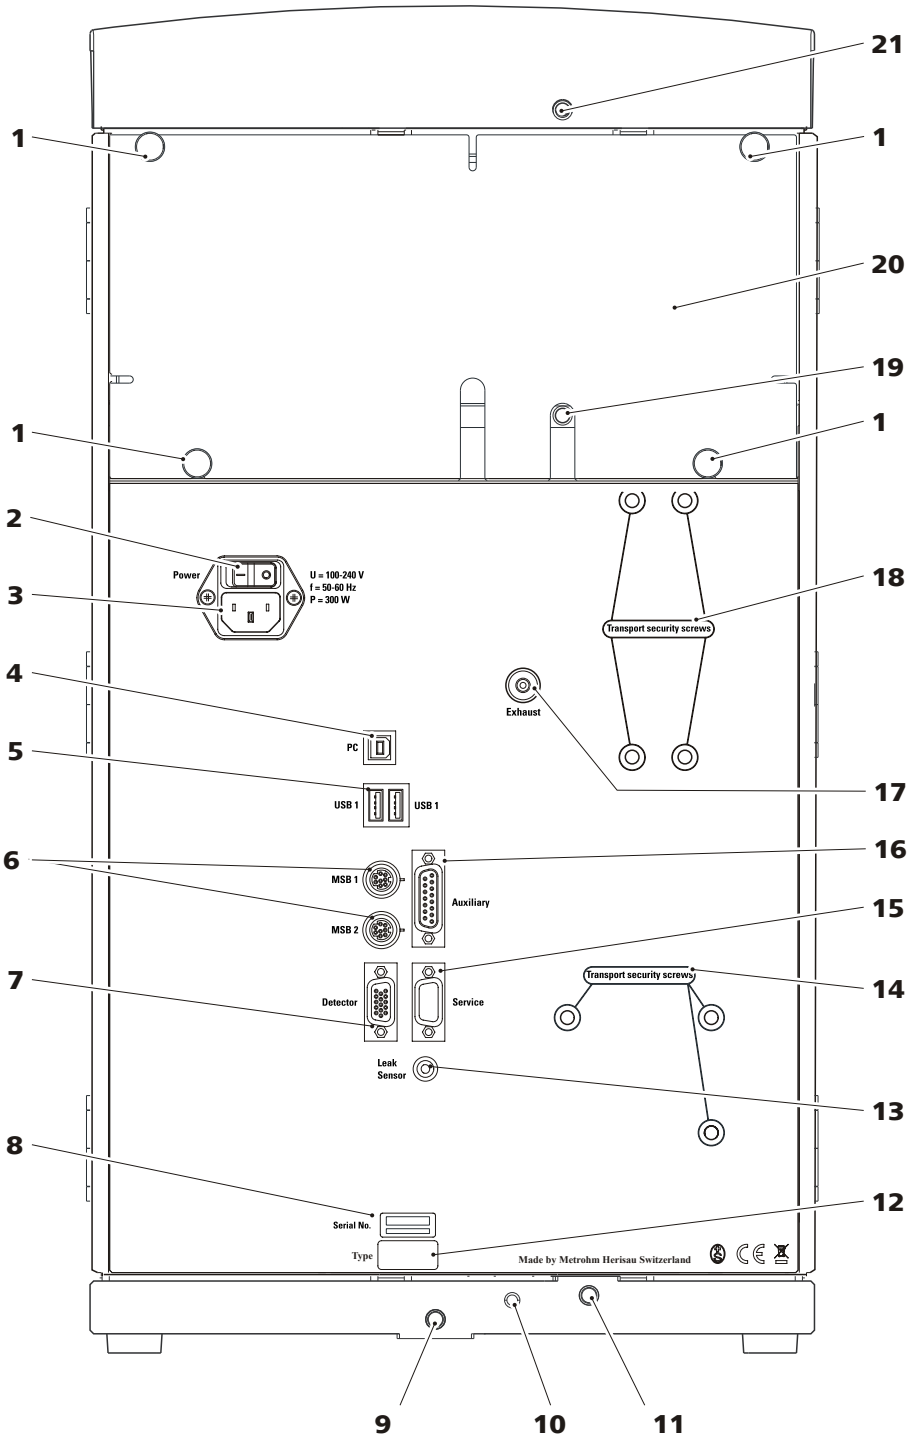

Figure 2 Rear 882 Compact IC plus – Cation

1 Knurled screws
For fastening the removable rear panel.

2 Mains switch
For switching the instrument on and off.
I = On
O = Off

3 Mains connection socket
For connecting the mains cable.

4 PC connection socket
For connecting the instrument to the computer with the USB cable (6.2151.020).

5 USB connectors
2 USB connectors labeled with **USB 1** and **USB 2**.

6 MSB connectors
2 MSB connectors for connecting MSB devices. Labeled with **MSB 1** and **MSB 2**.
MSB = Metrohm Serial Bus

7 Detector connection socket
For connecting Metrohm detectors. Labeled with **Detector**.

8 Serial number

9 Drainage tubing connector
For draining the escaped liquid from the base tray through the connected drainage tubing.

10 Leak sensor connection cable
Extractable. For connecting the leak sensor.

11 Drainage tubing connector
For supplying escaped liquid through the connected drainage tubing to the leak sensor.

12 Device type

13 Leak sensor connection socket
For connecting the leak sensor.

14 Transport locking screws
For securing the high pressure pump when transporting the instrument.

15 Service connection socket
For Metrohm service only.

16 Auxiliary connection socket
For connecting a 891 Professional Analog out (2.891.0010).

17 Exhaust air opening
For extracting the air from the vacuum chamber. Labeled with **Exhaust**.

18 Transport locking screws
Not Used.

19 Drainage tubing connector
For draining escaped liquid from the detector chamber through a connected drainage tubing.

20 Rear panel
Removable. Access to the detector chamber.

21 Drainage tubing connector
For draining escaped liquid from the flask holder through a connected drainage tubing.

3 Installation

3.1 About this chapter

The Installation chapter contains:

- this overview.
- a brief set of instructions for the initial installation of the 882 Compact IC plus – Cation. At each step you will find cross-references to more detailed installation instructions for individual components, should you require such aids.
- an installation diagram *(see Figure 3, page 12)*, showing a completely installed 882 Compact IC plus – Cation.
- several chapters with detailed installation instructions for all components, including those that are already installed at the time the instrument is delivered.

3.2 Initial installation

Note

A number of the capillaries is already connected at the time the instrument is delivered.

Installing 882 Compact IC plus – Cation

Install the instrument as follows:

1 Setting up the instrument

(see Chapter 3.4, page 13).

- Place the instrument in a location of the laboratory which is suitable for operation and free of vibrations.
  The installation site must be protected against corrosive atmosphere and contamination by chemicals. If possible, avoid excessive temperature fluctuations and direct sunlight.

2 Installations on the rear of the instrument

- Place the detector in the instrument and connect it *(see manual of the detector)*.
- Remove transport locking screws *(see Chapter 3.6.1, page 16)*.

- Connect the leak sensor *(see Chapter 3.6.2, page 16)*.
- Connect the drainage tubings *(see Chapter 3.6.3, page 17)*.

3 Connecting the eluent path

- Lead the eluent aspiration tubing (6.1834.080) out of the instrument through a capillary feed-through and connect it with the eluent bottle *(see Chapter 3.8, page 21)*.
- Connect the column inlet capillary (6.1831.150) and the detector inlet capillary with one another using a coupling (6.2744.040) and two short pressure screws (6.2744.070).

4 Connecting the sample path

- Guide the sample aspiration capillary connected to the sample input of the injection valve out of the instrument through a capillary feed-through and connect it with the Sample Processor, if applicable *(see Sample Processor manual)*.
- Guide the sample outlet capillary connected to the sample output of the injection valve out of the instrument through a capillary feed-through and onward to the waste container and then fasten it there.

5 Connecting the instrument

- Connect the instrument to a computer on which the software MagIC Net™ is installed using the USB cable (6.2151.020) *(see Chapter 3.13.1, page 34)*.
- Connect the instrument to the mains supply *(see Chapter 3.13.2, page 34)*.

6 Initial start-up

(see Chapter 4.1, page 39)

- Switch on the PC and start MagIC Net™.
- Switch on the instrument.
- Deaerate the high pressure pump *(see Chapter 3.9.2, page 27)*.
- Rinse the instrument without column with eluent for 5 minutes.

7 Installing guard and separation column

- Remove the coupling (6.2744.040) between the column inlet capillary and the detector inlet capillary.
- *Optional* Connect guard column *(see Chapter 3.14, page 35)*
  - Fasten the guard column to the end of the column inlet capillary *(see leaflet to the guard column)*.
  - Rinse the guard column with eluent for approx. 5 minutes.

- Connect the separation column *(see Chapter 3.15, page 37)*
  - Connect the inlet oft the separation column either with the end of the column input capillary using a short pressures screw (6.2744.070).
    OR
    Connect the inlet of the separation column with the guard column (if used) *(see leaflets to the separation column and the guard column)*
  - Fasten the detector inlet capillary to the output of the separation column using a short pressure screw (6.2744.070).
- Hang separation column with chip in the column holder of the instrument.

8 Conditioning the instrument
(see Chapter 4.2, page 40)

The instrument is now ready for measuring samples.

3.3 Installation diagram

The following installation diagram shows the schematics of the front of the instrument after installation is complete. Many capillaries are already installed at the time the instrument is delivered; these capillaries are not numbered in the diagram. Numbered capillaries must be connected at the time of installation.

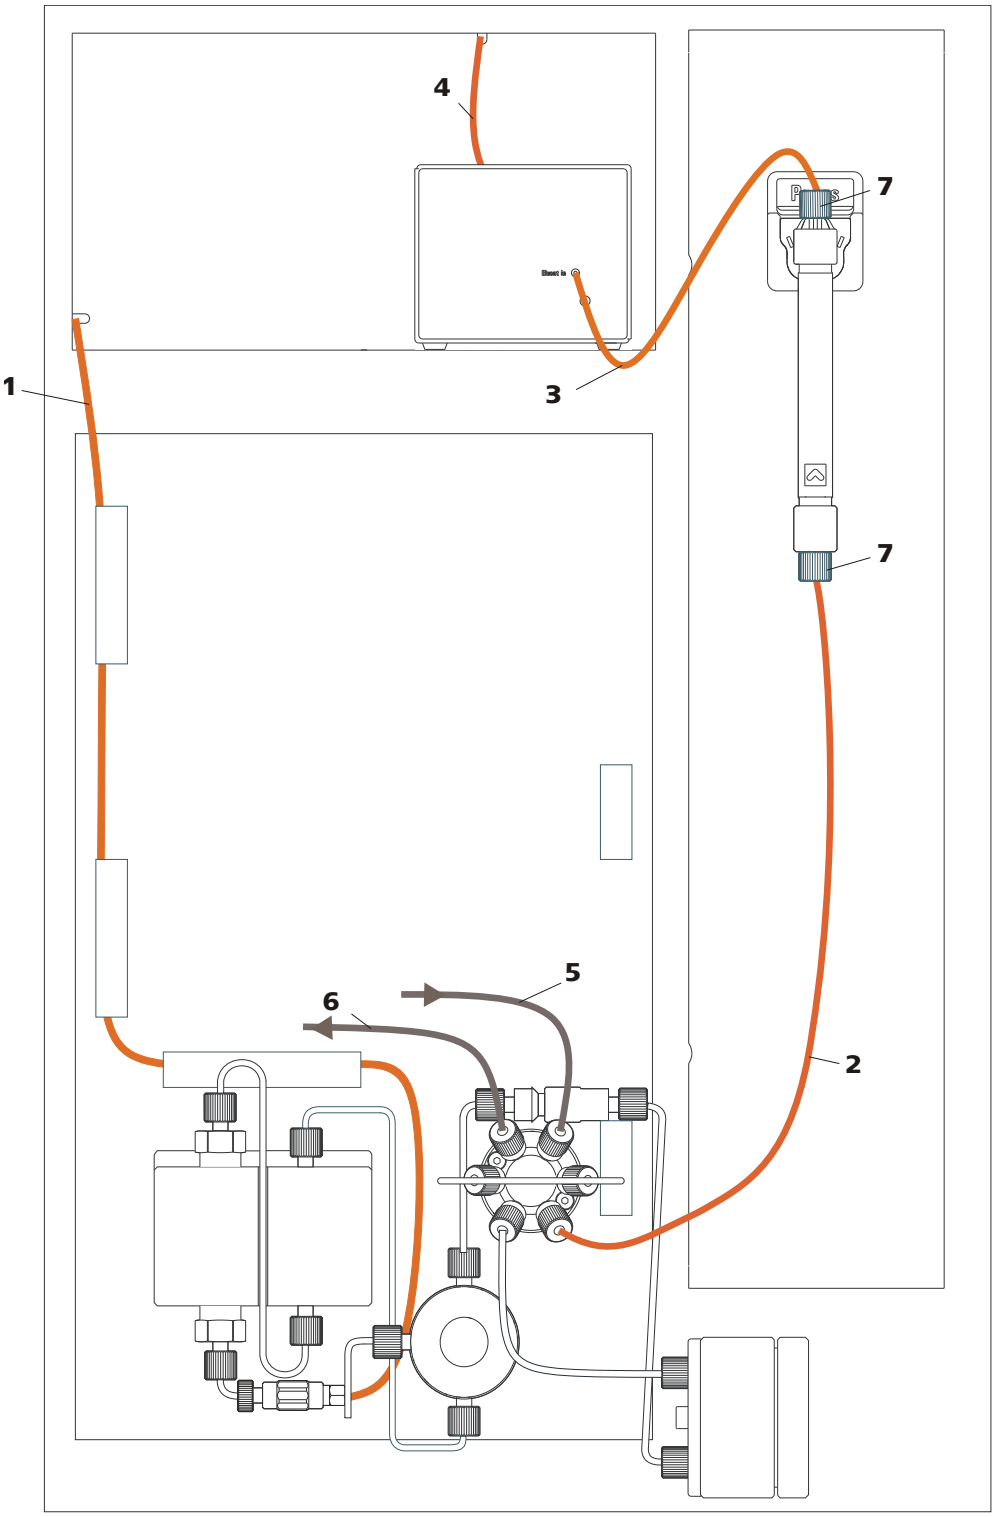

Figure 3 Installation diagram

1	**Eluent aspiration tubing (6.1834.080)** Connected to the high pressure pump.
2	**Column input capillary (6.1831.150)** Connected to the injection valve.
3	**Detector inlet capillary**
4	**Detector outlet capillary**
5	**Sample aspirating capillary** Connected to the injection valve.
6	**Sample outlet capillary** Connected to the injection valve.
7	**PEEK pressure screws, short (6.2744.070)**

3.4 Setting up the instrument

3.4.1 Packaging

The instrument is supplied in highly protective special packaging together with the separately packed accessories. Keep this packaging, as only this ensures safe transportation of the instrument.

3.4.2 Checks

Immediately after receipt, check whether the shipment has arrived complete and without damage by comparing it with the delivery note.

3.4.3 Location

The instrument has been developed for operation indoors and may not be used in explosive environments.

Place the instrument in a location of the laboratory which is suitable for operation, free of vibrations, protected from corrosive atmosphere, and contamination by chemicals.

The instrument should be protected against excessive temperature fluctuations and direct sunlight.

3.5 Capillary connections in the IC system

This chapter contains general information concerning the capillary connections in the IC instruments and systems.

Generally speaking, capillary connections between two components of an IC system are made up of one connection capillary and two pressure screws with which the capillary is connected to the respective components.

Pressure screws

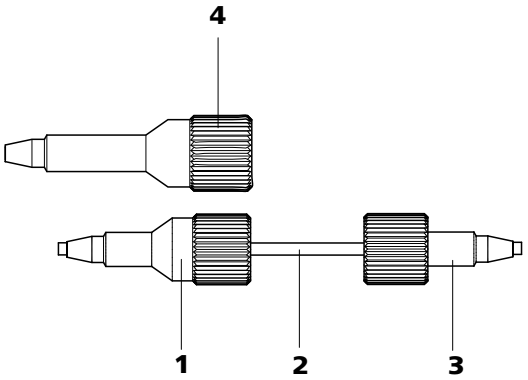

Figure 4 Connection of capillaries with pressure screws

1 **PEEK pressure screw (6.2744.014)** Use on the injection valve.	**2** **Connection capillary**
3 **PEEK pressure screw, short (6.2744.070)** For use on the high pressure pump, the purge valve, the inline filter, the pulsation absorber, the guard column and the separation column.	**4** **PEEK pressure screw, long (6.2744.090)** Use on special components. Is not used on all instruments.

Note

In order to keep the dead volume as low as possible, capillary connections should generally be as short as possible.

Note

For an improved overview, capillary and tubing connections can be bundled with the 6.1815.010 spiral band.

Connection capillaries

PEEK capillaries and PTFE capillaries are used in the IC system.

PEEK capillaries (polyetheretherketone)

PEEK capillaries are temperature-resistant up to 100°C, stable under pressure up to 400 bar, flexible, chemically inert and exhibit an extremely smooth surface. They can be readily cut down to the desired length with the 6.2621.080 capillary cutter.

Usage:

- PEEK capillaries (6.1831.010) with an internal diameter of 0.25 mm for the entire high pressure range.

- PEEK capillaries (6.1831.030) with an internal diameter of 0.75 mm for sample handling in the ultra trace range.

Caution

For the capillary connections between the injection valve and detector , PEEK capillaries with an internal diameter of 0.25 mm must be used. These are already connected to a newly delivered instrument.

PTFE capillaries (polytetrafluoroethylene)

PTFE capillaries are transparent and enable visual tracing of the liquids to be pumped. They are chemically inert, flexible and temperature-resistant up to 80°C.

Usage:

PTFE capillaries (6.1803.0x0) are used for the low pressure range.

- PTFE capillaries with internal diameter of 0.5 mm for sample handling.
- PTFE capillaries with internal diameter of 0.97 mm for sample handling as well as for rinsing solutions (they do not have to be in the scope of delivery of the instrument).

Capillary connections

In order to achieve optimum analysis results, capillary connections in an IC system must be absolutely tight and free of dead volume. Dead volume occurs if two capillary ends connected to each other do not fit exactly, thus allowing liquid to escape. There are two possible reasons for this:

- The capillaries do not have exactly cut edges.
- The two capillary ends do not completely meet.

One prerequisite for dead volume free capillary connection is, that both capillary ends are cut exactly plane. Therefore we recommend only to cut PEEK capillaries with the capillary cutter (6.2621.080).

Creating dead volume free capillary connections

To create dead volume free capillary connections, proceed as follows:

1. Slide the pressure screw over the capillary. Ensure that the capillary protrudes 1–2 mm from the tip of the pressure screw.
2. Plug the capillary all the way into the connection or coupling until the stop.
3. Only then start turning the pressure screw, while keeping the capillary pressed in space.

Colored sleeves for PEEK capillaries

The enclosed set of varicolored sleeves for PEEK capillaries (6.2251.000) serves to easily differentiate the various flows of liquid in the system through color coding. Each capillary leading a given liquid (e. g. eluent) can be highlighted with sleeves of the same color.

To highlight a capillary, proceed as follows:

1 Slide a sleeve of a selected color over a capillary an move it to an easily visible position.

If the capillary heats up, the sleeve shrinks and adapts to the form of the capillary.

3.6 Installations on the rear of the instrument

3.6.1 Transport locking screws

To avoid damage to the high pressure pump drive during transport, the pump is secured with transport locking screws. These are located at the rear of the instrument and labeled with **Transport security screws**.

Remove these transport locking screws before the initial start-up.

Removing transport locking screws

1 Remove all of the transport locking screws with the 4 mm hexagon key (6.2621.030) and keep them in a safe place.

Warning

In order to avoid damage to the high pressure pump, the transport locking screws must be remounted each time the instrument undergoes major transport.

3.6.2 Leak sensor

The leak sensor detects escaping liquid which collects in the base tray of the instrument.

For the leak sensor to function correctly, the following preconditions must be met:

- The leak sensor connector plug *(5-**2**)* is plugged into the **Leak Sensor** socket.
- The instrument is switched on.
- In the software, the leak sensor is set to **active**.

Connecting the leak sensor

Connect the leak sensor as follows:

1. Pull out the leak sensor connection cable *(5-**3**)* from the base tray.
2. Plug the leak sensor connector plug *(5-**2**)* into the leak sensor connection socket *(5-**1**)* on the rear of the instrument.

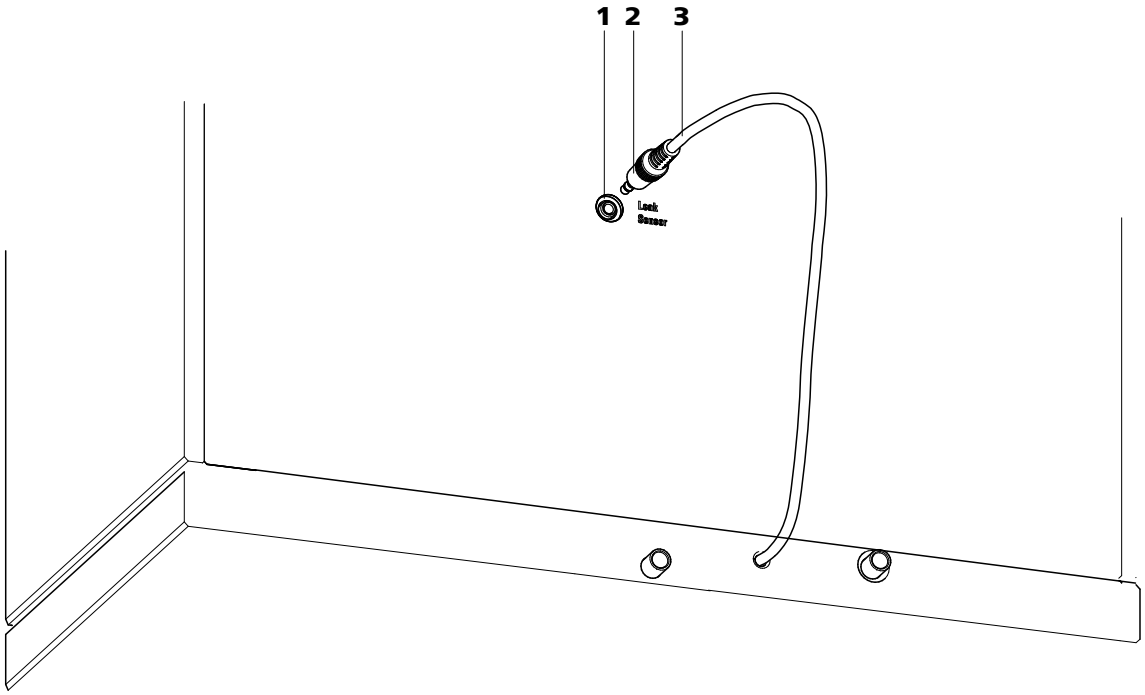

Figure 5 leak sensor – plugging in

1 **Leak sensor connection socket** Is labeled with **Leak Sensor**.	**2** **Leak sensor connector plug**
3 **Leak sensor connection cable** Extractable. Coiled up in the base tray.	

3.6.3 Drainage tubings

Fluid that escapes in the covering plate or in the detector chamber flows through the drainage tubings into the base tray and past the leak sensor into the waste container. This ensures that any leaks in the system will be detected by the leak sensor.

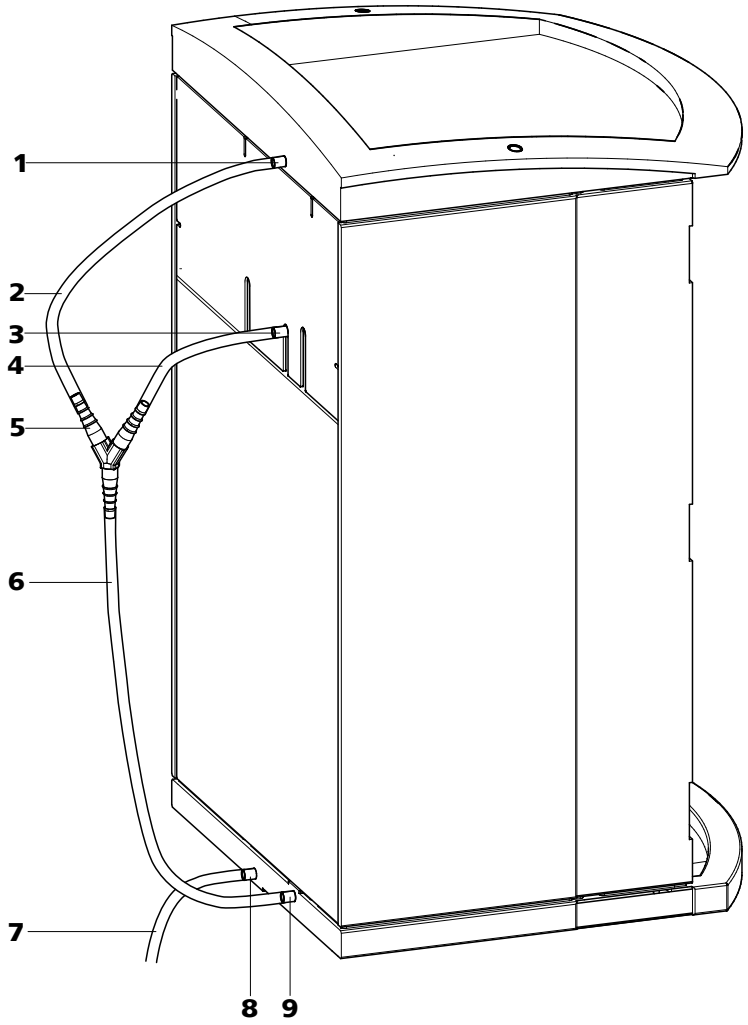

Figure 6 Drainage tubings

1 **Drainage tubing connection** For draining escaped liquid from the cover.	**2** **Drainage tubing** Section of the 6.1816.020 silicon tubing. For draining escaped liquid from the cover.
3 **Drainage tubing connection** For draining escaped fluid from the detector chamber.	**4** **Drainage tubing** Section of the 6.1816.020 silicon tubing. For draining escaped fluid from the detector chamber.
5 **Y connector (6.1807.010)** For connecting the two drainage tubings *(6-**2**)* and *(6-**4**)*.	**6** **Drainage tubing** Section of the 6.1816.020 silicon tubing. Guides escaped fluid to the leak sensor.
7 **Drainage tubing** Section of the 6.1816.020 silicon tubing. Guides escaped fluid into a waste container.	**8** **Drainage tubing connection** For draining escaped fluid.
9 **Drainage tubing connection** Leads to the leak sensor.	

Installing drainage tubings

Proceed as follows to install the drainage tubings:

1. Connect drainage tubing *(6-**2**)* to the drainage tubing connection *(6-**1**)* and shorten to the required length.

2. Connect drainage tubing *(6-**4**)* to the drainage tubing connection *(6-**3**)* and shorten to the required length.

3. Connect drainage tubing *(6-**2**)* and drainage tubing *(6-**4**)* to the Y connector *(6-**5**)*.

4. Connect drainage tubing *(6-**6**)* to the Y connector *(6-**5**)*, shorten to the required length and connect the other end of the drainage tubing to the drainage tubing connection *(6-**9**)*.

5. Connect drainage tubing *(6-**7**)* to the drainage tubing connection *(6-**8**)* and guide the other end into a waste container.

3.7 Capillary and cable feed-throughs

Several openings have been integrated for feeding through capillaries and cables. These can be found at the door, at the rear panel, and below the bottle holder and above the base tray *(see Figure 7, page 20)*.

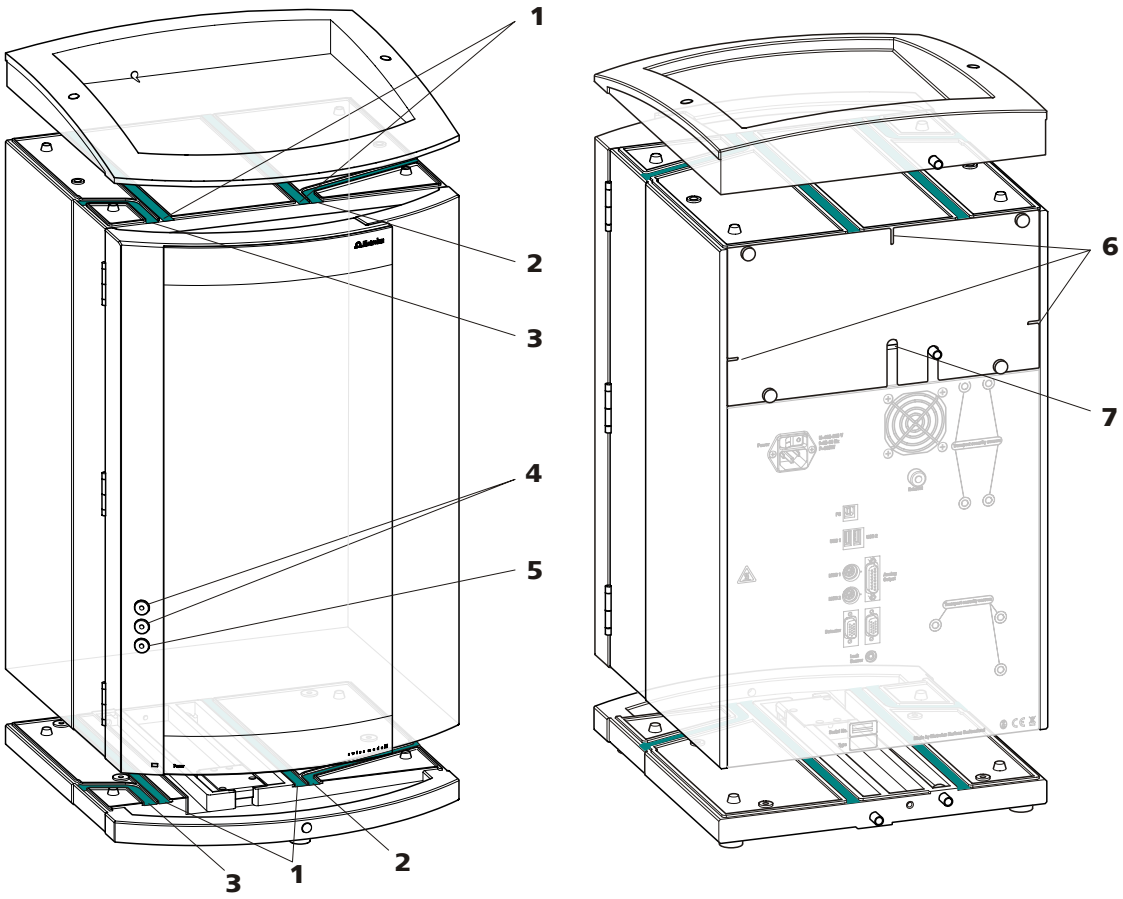

Figure 7 Capillary and cable feed-throughs

1 **Capillary feed-through** For feeding capillaries from the front to the rear of the instrument.	**2** **Capillary feed-through** Fro feeding capillaries from the front to the right side of the instrument.
3 **Capillary feed-through** For feeding capillaries from the front to the left side of the instrument.	**4** **Luer connector** For connecting a (6.2816.020) syringe. For manual sample feeding.
5 **Capillary feed-through** At the door of the instrument. For feeding capillaries out of the instrument.	**6** **Capillary feed-through** At the rear of the instrument. For feeding capillaries out of the detector chamber.
7 **Cable feed-through** At the rear of the instrument. For feeding the detector cable out of the detector chamber.	

Do not feed capillaries through the Luer connectors *(7-**4**)*. The capillaries are fastened with PEEK pressure screws (6.2744.070) from inside to the Luer connector. From outside, liquid can be aspirated or injected with a syringe.

3.8 Eluent

3.8.1 Connecting eluent bottle

The eluent is aspirated out of the eluent bottle via the eluent aspiration tubing *(8-**1**)*.

The eluent aspiration tubing is connected to the high pressure pump *(see Chapter 3.9, page 25)* (see Chapter , page). The tubing must be threaded through a suitable capillary feed-through *(see Chapter 3.7, page 19)* of the instrument before the other end can be equipped.

You will require the parts from the following accessories for equipping the eluent aspiration tubing:

- 6.1602.160 Eluent bottle attachment GL 45
- 6.2744.210 tubing adapter for aspiration filter
- 6.2821.090 aspiration filter

To equip the eluent aspiration tubing proceed as follows:

Assembling eluent aspiration tubing

1 Guide the free end of the eluent aspiration tubing *(8-**1**)* out of the instrument through a suitable capillary feed-through.

2 **Installing eluent bottle attachment (6.1602.160)**

- Slide tubing nipple *(8-**2**)* and O-ring *(8-**3**)* onto the eluent aspiration tubing *(8-**1**)*.
- Push eluent aspiration tubing *(8-**1**)* through the bottle attachment *(8-**4**)* and screw tight.

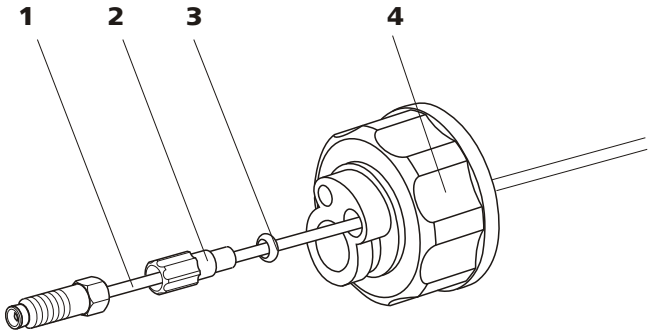

Figure 8 Installing eluent bottle attachment

1 **Eluent aspiration tubing (6.1834.080)**	**2** **Tubing nipple** From accessories set (6.1602.160).
3 **O-ring** From accessories set (6.1602.160).	**4** **Bottle attachment** From accessories set (6.1602.160).

3 Mounting aspiration filter

- Insert filter holder *(9-**1**)* into the aspiration filter *(9-**2**)* and screw tight.

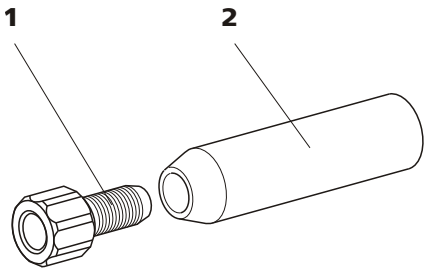

Figure 9 Mounting aspiration filter

1 **Filter holder** From accessories set (6.2744.210).	**2** **Aspiration filter (6.2821.090)**

4 Install tubing weighting and aspiration filter

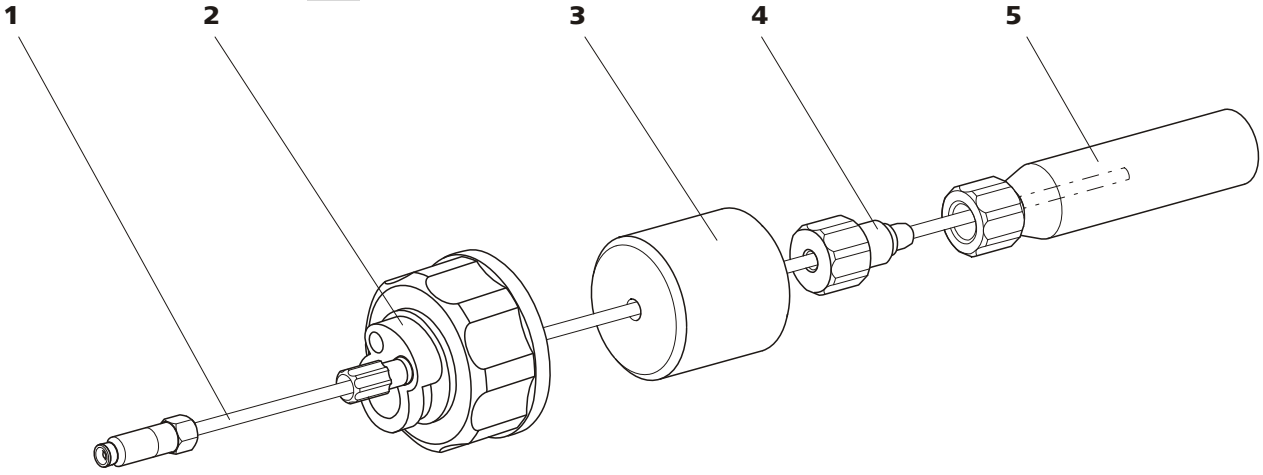

Figure 10 Install tubing weighting and aspiration filter

1 **Eluent aspiration tubing (6.1834.080)**	**2** **Eluent bottle attachment (6.1602.160)**
3 **Tubing weighting** From accessories set (6.2744.210).	**4** **Clamping screw** From accessories set (6.2744.210).
5 **Aspiration filter (6.2821.090)** With filter holder from accessories set (6.2744.210).	

- Slide the tubing weighting *(10-**3**)* onto the eluent aspiration tubing *(10-**1**)*.
- Slide the clamping screw *(10-**4**)* onto the eluent aspiration tubing *(10-**1**)*.
- Insert eluent aspiration tubing *(10-**1**)* into the aspiration filter *(10-**5**)*. The end of the tubing should approximately reach to the center of the aspiration filter.
- Screw together clamping screw *(10-**4**)* and filter holder *(9-**1**)*.

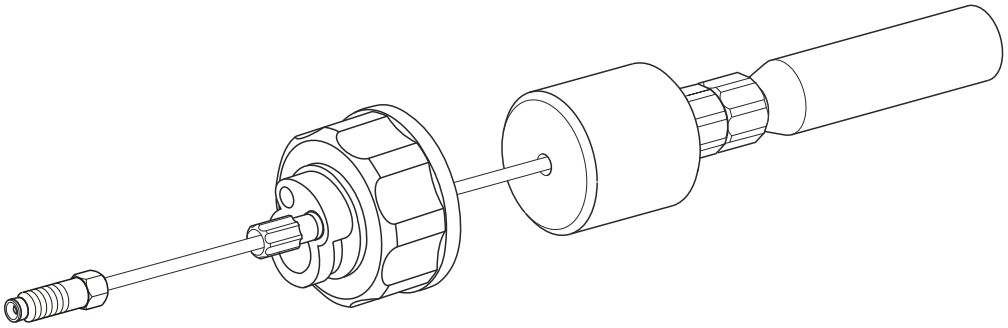

Figure 11 Eluent aspiration tubing fully equipped.

5 Mounting eluent aspiration tubing to the eluent bottle

- Insert the eluent aspiration tubing into the eluent bottle *(12-**10**)*.
- Fasten the completely equipped bottle attachment *(10-**2**)* on the eluent bottle *(12-**10**)*. The aspiration filter *(12-**6**)* must rest on the base of the eluent bottle.
- Close the remaining small opening on the bottle attachment with a threaded stopper *(12-**14**)* from the accessories set.

6 Mounting the adsorber tube

Note

If alkaline eluents and eluents with lower buffer capacity are used, the eluent bottle must be equipped with an adsorber tube filled with CO_2 adsorber *(12-**4**)*.

- First, place a piece of cotton *(12-**3**)*, then the CO_2 adsorber *(12-**4**)* in the large opening of the adsorber tube *(12-**2**)* and close with the plastic cover.
- Fasten the adsorber tube *(12-**2**)* onto the bottle attachment *(12-**11**)* using the SGJ clip *(12-**12**)*.

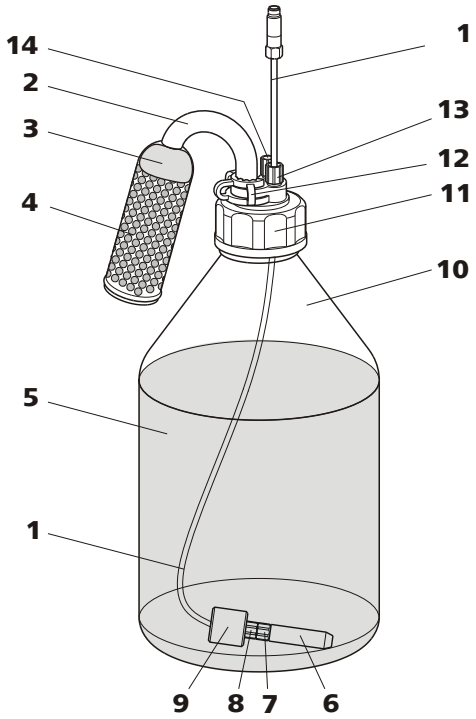

Figure 12 Eluent bottle – connected

7	**Filter holder** From accessories set (6.2744.210).	**8**	**Clamping screw** From accessories set (6.2744.210).
9	**Tubing weighting** From accessories set (6.2744.210).	**10**	**Eluent bottle (6.1608.070)**
11	**Bottle attachment (6.1602.160)**	**12**	**SGJ clip (6.2023.020)**
13	**Tubing nipple**	**14**	**Threaded stopper**

3.9 High pressure pump

The intelligent and low pulsation high pressure pump pumps the eluent through the system. It is equipped with a chip on which its technical specifications and "life history" (operating hours, service data, …) are saved.

The purge valve is used for deaerating *(see Chapter 3.9.2, page 27)* the high pressure pump.

3.9.1 Capillary connections high pressure pump/purge valve

Note

All of the capillary connections of the high pressure pump and the purge valve are already installed in the newly delivered instrument.

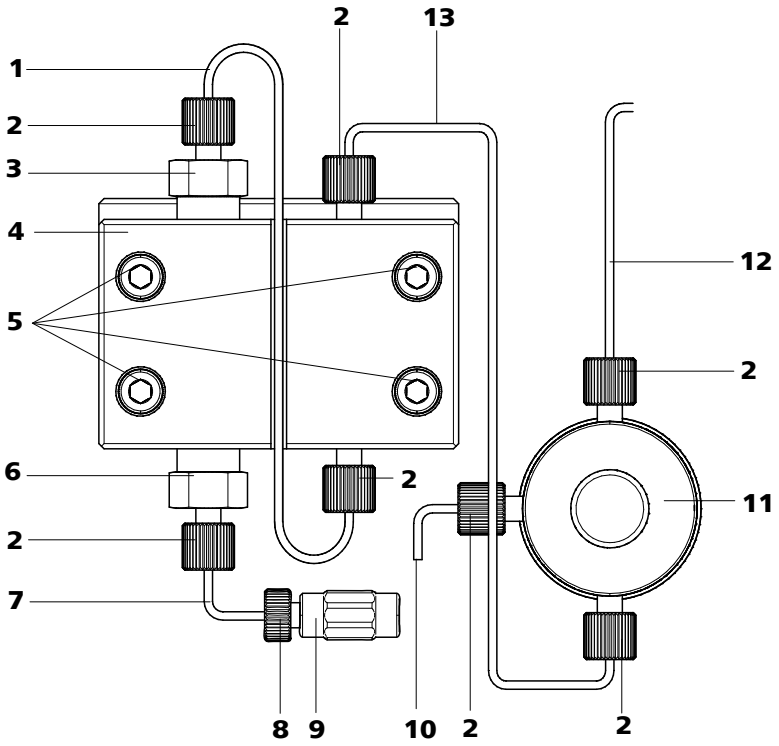

Figure 13 Capillary connections high pressure pump/purge valve

1	**Connection capillary** PEEK capillary, connects main piston and auxiliary piston.
2	**PEEK pressure screw, short (6.2744.070)**
3	**Outlet valve holder**
4	**Pump head (6.2824.110)**
5	**Fastening screws** For fastening the pump head.
6	**Inlet valve holder**
7	**Pump head inlet capillary** PEEK capillary at the input of the pump head.
8	**Pressure screw** For connecting a PEEK capillary to the coupling *(13-**8**)*.
9	**Coupling** For the connection of the eluent path at the input of the high pressure pump. Can be ordered together with the pressure screw *(13-**8**)* under the number (6.2744.230).
10	**Deaerating capillary** For aspirating the eluent when deaerating the high pressure pump *(see Chapter 3.9.2, page 27)*.
11	**Purge valve** For deaerating the high pressure pump. With rotary knob in the center and pressure sensor.
12	**Connection capillary** For connecting the inline filter *(see Chapter 3.10, page 29)*.
13	**Connection capillary** Connects the output of the pump head with the purge valve.

Note

The eluent aspiration capillary is already installed in the newly delivered instrument. The following installation instructions need **not** be carried out at the time of initial installation.

Connecting inlet to the high pressure pump

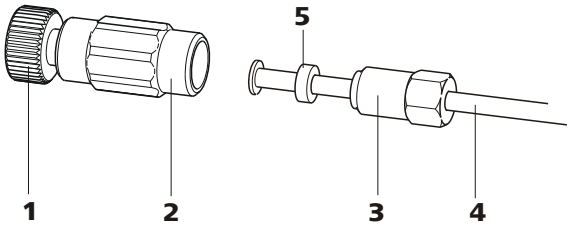

Figure 14 High pressure pump – Connect inlet

1	**Pressure screw** For connecting the coupling *(14-**2**)* to the pump head inlet capillary *(13-**7**)*. Can be ordered together with the coupling under the number (6.2744.230).
2	**Coupling (6.2744.230)** For connecting the eluent connection capillary *(14-**4**)* to the input of the high pressure pump.
3	**Clamping screw**
4	**Eluent aspiration tubing** Eluent aspiration tubing (6.1834.080) or (6.1834.090).
5	**Backup ring**

1 Connecting coupling

Fasten the coupling *(14-**2**)* with a pressure screw *(14-**1**)* on the pump head inlet capillary *(13-**7**)*.

2 Connecting eluent aspiration tubing

Caution

The clamping screws must be tightened carefully. To tighten, grip the coupling *(14-**2**)* with the key (6.2739.000) and grip the clamping screw *(14-**3**)* with the wrench (6.2621.050).

- Plug the eluent aspiration tubing *(14-**4**)* into the coupling *(14-**2**)*.
- Tighten the clamping screw *(14-**3**)*.

3.9.2 Deaerating the high pressure pump

The high pressure pump will only operate perfectly if the pump head contains no more air bubbles. Therefore it must be deaerated during initial start-up and after every change of eluent.

Caution

The high pressure pump must **not** be deaerated before the initial start-up .

Deaerate the high pressure pump as follows *(see Figure 15, page 28)*:

Deaerate the high pressure pump

The instrument must be connected to the PC and switched on to deaerate the high pressure pump.

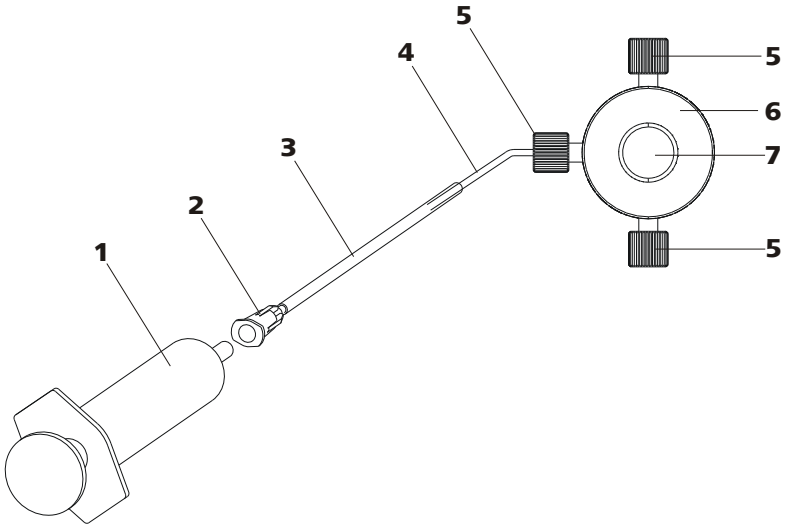

Figure 15 Deaerate the high pressure pump

1 **Syringe 10 mL (6.2816.020)** For aspirating the eluent.	**2** **Luer connector** Part of the purging needle (6.2816.040)
3 **Purging needle (6.2816.040)**	**4** **Deaerating capillary**
5 **PEEK pressure screws, short (6.2744.070)**	**6** **Purge valve**
7 **Purge valve rotary knob**	

1 Connecting the purging needle

- Push the end of the purging needle *(15-**3**)* over the end of the deaerating capillary *(15-**4**)* on the purge valve.

2 Connecting the syringe

- Insert syringe *(15-**1**)* in the Luer connector *(15-**2**)* of the purging needle *(see Figure 15, page 28)*.

3 Opening purge valve

- Open the rotary knob *(15-**7**)* by approx. ½ rotation counterclockwise.

4 Setting the flow rate

- Start MagIC Net™ (if not yet started).
- Ensure that the eluent aspiration tubing is immersed sufficiently in the eluent.
- Let the high pressure pump run.

5 Aspirating eluent

- Aspirate with the syringe *(15-**1**)* until bubble-free eluent flows into the syringe.

6 Completing deaerating

- Switch off high pressure pump.
- Close rotary knob *(15-**7**)*.
- Remove syringe *(15-**1**)* from the Luer connector *(15-**2**)*.
- Pull the purging needle *(15-**3**)* out of the deaerating capillary *(15-**4**)*.

3.10 Inline filter

Between the purge valve and the pulsation absorber the inline filter (6.2821.120) is installed as protection against particles.

Inline filters protect the separation column securely against possible contamination from the eluent. Inline filters can however also just as well be used for the purpose of protecting the suppressor against contaminations in the regeneration or rinsing solutions. The filter platelets with a pore size of 2 µm can be replaced quickly and easily. They remove particles like e. g. bacteria and algae from the solutions.

Note

The inline filter is already installed in the newly delivered instrument. The following installation instructions need **not** be carried out at the time of initial installation.

Installing the inline filter

Caution

Observe the flow direction marked on the filter housing for the connection of the inline filter.

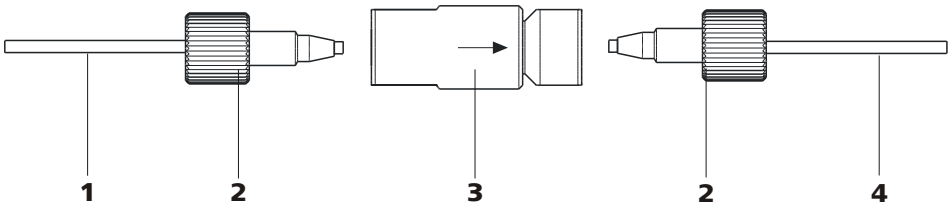

Figure 16 Connecting the inline filter

1 **Connection capillary** Connects the purge valve with the inline filter	**2** **PEEK pressure screws, short (6.2744.070)**
3 **Inline filter (6.2821.120)** Protects against particles.	**4** **Connection capillary** Connects the inline filter with the pulsation absorber.

1 Screw on the connection capillary running from the purge valve to the input side of the inline filter using a pressure screw (6.2744.070).

2 Screw on the connection capillary running to the pulsation absorber to the output side of the inline filter using a pressure screw (6.2744.070).

3.11 Pulsation absorber

Note

The pulsation absorber is already installed in the newly delivered instrument.

Caution

The pulsation absorber is maintenance-free and may not be opened.

The pulsation absorber protects the separation column from damage caused by pressure fluctuations when switching the injection valve, and reduces interfering pulsations during highly sensitive measurements. In order to ensure these functionalities, it must be connected between the high pressure pump *(see Chapter 3.9, page 25)* and injection valve *(see Chapter 3.12, page 31)*.

The pulsation absorber can be operated in both directions.

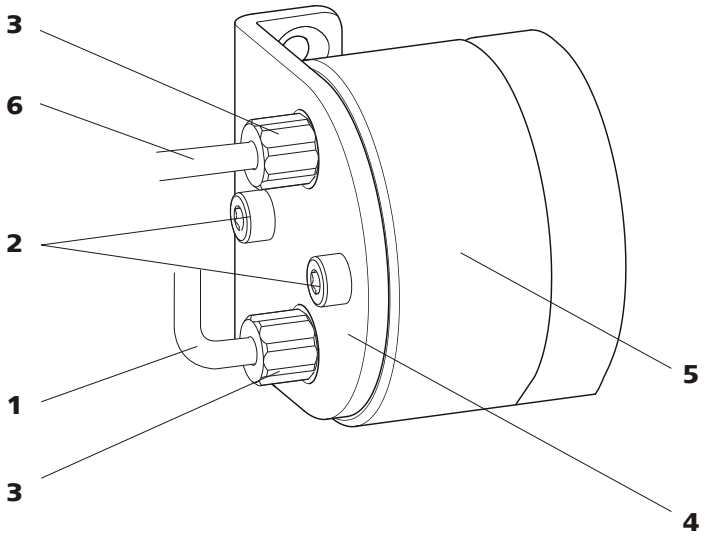

Figure 17 Pulsation absorber – Connection

1	**Connection capillary** Connection to the inline filter.	**2**	**Fastening screws**
3	**PEEK pressure screws, short (6.2744.070)**	**4**	**Holder for pulsation absorber**
5	**Pulsation absorber (6.2620.150)**	**6**	**Connection capillary** Connection to the injection valve.

3.12 Injection valve

The injection valve connects the eluent and sample path. Through rapid and precise valve switchover a precise amount of sample solution defined by the size of the sample loop is injected and rinsed with eluent onto the separation column.

3.12.1 Connecting the injection valve

The injection valve has six connectors: two for the sample path (connectors 1 and 2), two for the eluent path (connectors 4 and 5) and two for the sample loop (connectors 3 and 6).

Note

The capillaries of the eluent path and the sample path and the sample loop are already installed in the newly delivered instrument.

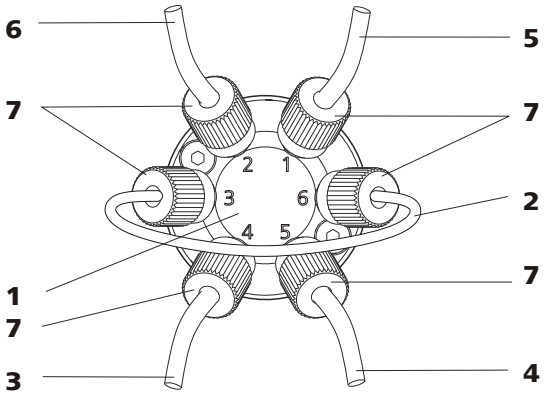

Figure 18 Injection valve – connected

1 **Injection valve**	**2** **Sample loop** Connected to connectors 3 and 6.
3 **Connection capillary** Connected to connector 4. Carries eluent to the injection valve.	**4** **Connection capillary (column inlet capillary)** Connected to connector 5. Carries eluent to the separation column.
5 **Connection capillary** Connected to connector 1. Carries sample to the injection valve.	**6** **Connection capillary** Connected to connector 2. Carries sample to the waste container.
7 **PEEK pressure screw 6.2744.010**	

Replacing the sample loop

The sample loop can be replaced, depending on requirements. For additional information concerning selection of the appropriate sample loop, *see Chapter 3.12.3, page 34*.

Note

Use only 6.2744.010 PEEK pressure screws for connecting capillaries and sample loop to the injection valve.

1 Removing existing sample loop

- Loosen 6.2744.010 pressure screws at connector 3 and connector 6.
- Remove sample loop.

2 Mounting new sample loop

- Fasten one end of the sample loop *(18-**2**)* with a 6.2744.010 PEEK pressure screw *(18-**7**)* to connector 3.
- Fasten the other end of the sample loop *(18-**2**)* with a second 6.2744.010 PEEK pressure screw *(18-**7**)* to connector 6.

3.12.2 Mode of operation of the injection valve

The injection valve *(see Figure 19, page 33)* can adopt two valve positions - **FILL** and **INJECT**. Switching back and forth between the two valve positions determines whether the sample path or the eluent path is guided through the sample loop. The following figure provides a schematic display of the flow paths of the two valve positions.

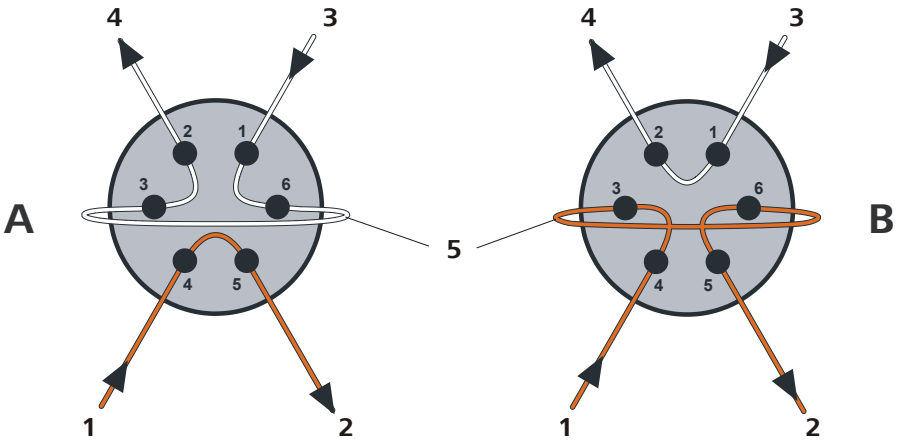

Figure 19 Injection valve – Positions

A	**Position FILL**	**B**	**Position INJECT**
1	**Eluent input** Capillary coming from the high pressure pump.	**2**	**Eluent output** Capillary to the column.
3	**Sample input** Sample aspirating capillary.	**4**	**Sample output** Capillary to waste container.
5	**Sample loop**		

Position A

In the position **FILL**, the sample solution flows through the sample loop to the waste container. The eluent flows directly to the separation column at the same time.

Position B

In the position **INJECT**, the eluent flows through the sample loop to the separation column. If sample solution is to be found in the sample loop at the time of the valve switchover, then this will be conveyed along with the eluent, thus making its way to the separation column. The flow in the sample path is either stopped or the sample flows directly to the waste container.

3.12.3 Selecting the sample loop

The amount of sample solution injected depends on the volume of the sample loop. The choice is made on the basis of the application. The following sample loops are normally used:

Cation determination	10 µL
Anion determination with suppression	20 µL
Anion determination without suppression	100 µL

3.13 Connecting the instrument

3.13.1 Connecting the instrument to the PC

Note

The instrument must be switched off when connecting the PC.

1 Connecting the USB cable

Connect the PC connection socket of the instrument to a USB connector of the computer via the (6.2151.020) USB cable.

3.13.2 Connecting the instrument to mains supply

Warning

The power supply unit must not get wet. Protect it against the direct effect of liquids.

Mains cable

Which mains cable is supplied depends on the location:

- 6.2122.020 with plug SEV 12 (Switzerland, …)
- 6.2122.040 with plug CEE(7), VII (Germany, …)
- 6.2122.070 with plug NEMA 5-15 (USA, …)

The mains cable is three-core and provided with a plug with grounding. If another plug has to be mounted, the yellow/green conductor (IEC standard) must be connected to the protective ground (protection class I).

1 Connecting the mains cable

- Plug the mains cable into the mains connection socket .
- Connect the mains cable to the mains supply.

2 Switching on the instrument

Switch on the instrument using the mains switch .

After switching on, the LED on the front of the instrument flashes while a system test is carried out and the connection to the software is established. Once the system test is complete and the connection to the software has been established, the LED lights up continuously.

3.14 Guard column

The use of guard columns serves for protecting the separation columns and increasing their service life considerably. The guard columns available from Metrohm represent either actual guard columns or are so-called guard column cartridges which are used together with a cartridge holder. The installation of a guard column cartridge in the associated holder is described in the leaflet of the guard columns.

Note

Information regarding which guard column is suitable for your separation column can be found in the **Metrohm IC Column Program** (which is available from your Metrohm agent), the leaflet provided along with your separation column, the product information on the separation column at *http://www.metrohm.com* (product area Ion Chromatography), or obtained directly from your agent.

Caution

New guard columns are filled with solution and are sealed on both sides with stoppers or caps, respectively. Before using the guard column, you need to ensure that this solution is miscible with the eluents used (observe manufacturer's data).

Note

The guard column may only be installed after the **initial start-up** *(see Chapter 4.1, page 39)* of the instrument. Until then, use the coupling (6.2744.040) instead of the guard and separation column.

Note

Metrohm recommends, always to work with guard columns. These protect the separation column and can be exchanged regularly.

Connecting and rinsing the guard column

1 Connecting the guard column

Caution

When inserting the guard column, always ensure that it is inserted correctly corresponding to the flow direction (if indicated).

- Remove sealing caps and/or stoppers from the guard column.
- Fasten the input of the guard column to the column inlet capillary using a short PEEK pressure screw (6.2744.070).
- In case the guard column is mounted on the separation column with a connecting capillary, connect the included connection capillary, which is included with the guard column, to the output of the guard column using the PEEK pressure screw, which is .also included.

2 Rinsing the guard column

- Place beaker under the outlet capillary of the guard column.
- Set the flow rate of the high pressure pump according to the data given in the leaflet of the separation column.
- Start the high pressure pump and rinse the guard column approx. 5 minutes with eluent.
- Switch off the high pressure pump again.

3.15 Separation column

The intelligent separation column (iColumn) is the heart of the ion chromatographic analysis. It separates the different components corresponding to their interactions with the column. Metrohm separation columns are equipped with a chip on which their technical specifications and their history (first use / setting up, operating hours, injections, …) are saved.

Note

Information regarding which separation column is suitable for your application can be found in the **Metrohm IC Column Program**, the product information for your separation column at *http://www.metrohm.com* in the product area ion chromatography, or obtained directly from your agent.

Caution

New separation columns are filled with solution and are sealed on both sides with stoppers. Before using the column, you need to ensure that this solution is miscible with the eluents used (observe manufacturer's data).

You can find the separation columns and guard columns currently available from Metrohm in the Metrohm IC Column Program, or in the Internet at *http://www.metrohm.com* in the product area Ion Chromatography. A test chromatogram and an leaflet are provided along with each column. You can request detailed information on special IC applications in the corresponding "**Application Bulletins**" or "**Application Notes**", available in the Internet at *http://www.metrohm.com* in the Applications area or via the Metrohm agent responsible free of charge.

Note

The separation column may only be installed after the **initial start-up** *(see Chapter 4.1, page 39)* of the instrument. Until then, use the coupling (6.2744.040) instead of the guard and separation column.

Connecting and rinsing the separation column

1 Connect the separation column

Caution

When inserting the columns, always ensure that these are correctly inserted corresponding to the flow direction indicated.

- Remove stoppers from the separation column.
- Attach the guard column to the input of the separation column.
  OR
  Connect the input of the separation column to the outlet capillary of the guard column, using the PEEK pressure screw (6.2744.070) included.
  OR
  If no guard column is used (not recommended), connect the column input capillary to the input of the separation column, using a PEEK pressure screw (6.2744.070).

2 Rinsing the separation column

- Place beaker under the outlet end of the separation column.
- Set the flow rate of the high pressure pump according to the data given in the leaflet of the separation column.
- Start the high pressure pump and rinse the separation column approx. 10 minutes with eluent.
- Switch off the high pressure pump again.

3 Mounting the separation column

- Fasten the column output capillary to the output of the separation column using a PEEK pressure screw (6.2744.070).
- Hang separation column with chip into the column holder.

Note

The iColumns are equipped with a chip on which their operating data is saved. The chip has to be hooked into the chip holder provided for this so that the column recognition can function.

4 Start-up

The chapter *Start-up* is divided into 2 sections:

Initial start-up	The **initial start-up** is carried out during the **initial installation**.
Conditioning	Conditioning is carried out as a final installation step and each time after the system is started.

4.1 Initial start-up

The initial start-up is carried out during the initial installation. The entire system is rinsed before guard column and separation column are installed.

Caution

The separation column and guard column may not be installed for the initial start-up.

Make sure that the coupling (6.2744.040) is being used instead of the columns.

Perform the following steps during the initial start-up:

1 Preparing the software

- Start the PC program **MagIC Net™**.
- Open the **Equilibration** tab in **MagIC Net™**.
- Select (or create) a suitable method.

2 Preparing the instrument

- Ensure that the eluent aspiration tubing is immersed in the eluent and that there is enough eluent in the eluent bottle.
- Switch on the instrument.

3 Deaerate the high pressure pump

- Deaerate the high pressure pump(s) via the purge valve *(see Chapter 3.9.2, page 27)*.

4 Rinsing the instrument without columns

- Rinse the instrument (without columns) with eluent for 5 minutes.

The instrument is now ready for the installation of the columns.

4.2 Conditioning

After the installation and after switching on the instrument, the system must be conditioned with eluent until a stable baseline is reached.

Note

After a change of eluent *(see Chapter 5.4.2.3, page 45)*, the conditioning time can lengthen considerably.

Conditioning the system

1 Preparing the software

Caution

Ensure that the flow set is not higher than the flow permissible for the corresponding column (see column leaflet and chip data set).

- Start the PC program **MagIC Net™**.
- Open the **Equilibration** tab in **MagIC Net™**.
- Select (or create) a suitable method.

2 Preparing the instrument

- Ensure that the column is correctly mounted according to the flow direction indicated on the label (arrow must point in the direction of flow).
- Ensure that the eluent aspiration tubing is immersed in the eluent and that there is enough eluent in the eluent bottle.

3 Checking leak-tightness

- In **MagIC Net™**, start the equilibration.
- Check all capillaries and their connections from the high pressure pump to the detector block for signs of liquid escaping. If eluent escapes anywhere, tighten the corresponding pressure screw or loosen the connection, check the end of the capillary, shorten it with a capillary cutter if necessary, and restore the connection.

4 Conditioning the system

Rinse the system with eluent until the required stability of the baseline is attained (normally 30 minutes).

The instrument is now ready for measuring samples.

5 Handling and maintenance

5.1 General notes

5.1.1 Care

Warning

The instrument housing must not be opened by untrained personnel.

The instrument requires appropriate care. Excess contamination of the instrument may result in functional disruptions and a reduction in the service life of the sturdy mechanics and electronics.

Caution

Although this is prevented to a great extent by design measures, the mains plug should be unplugged immediately if aggressive media has penetrated the inside of the instrument, so as to avoid serious damage to the instrument electronics. In such cases, the Metrohm Service must be informed.

On the rear of the instrument, the drainage tubings must be mounted and the leak sensor must be plugged in and activated as protection against escaping liquids.

Spillages of chemicals and solvents should be cleaned up immediately. In particular, the plug connections on the rear panel of the instrument (especially the mains plug) should be protected from contamination.

5.1.2 Maintenance by Metrohm Service

Maintenance of the instrument is best carried out as part of an annual service, which is performed by specialist personnel from Metrohm. If working frequently with caustic and corrosive chemicals, a shorter maintenance interval is recommended. The Metrohm service department offers every form of technical advice for maintenance and service of all Metrohm instruments.

5.1.3 Operation

Caution

In order to avoid disturbing temperature influences, the entire system including the eluent bottle must be protected against direct sunlight.

5.1.4 Shutting down

If the instrument is not used for a longer period, the whole IC system (except the columns) must be rinsed salt free with methanol/ultrapure water (1:4), in order to prevent eluent salts from forming crystals which may cause subsequent damage.

Rinsing salt free the IC system

To rinse the system, proceed as follows:

1. Remove the separation column from the eluent path. Connect the connection capillaries directly with each other using a coupling (6.2744.040).

2. Rinse the IC system with methanol/ultrapure water (1:4) for 15 minutes.

Rinse with eluent for at least 15 minutes at starting up again and before connecting the guard column and separation column.

5.2 Capillary connections

5.2.1 Operation

All connections between injection valve, separation column and detector must be as short as possible, have a low dead volume and be completely leak-tight. The PEEK capillary after the detector must be free of blockages. Only use PEEK capillaries with an internal diameter of 0.25 mm in the high pressure range between the high pressure pump and the detector.

5.3 Door

Caution

The door is made of PMMA (polymethylmetacrylate). It must never be cleaned with abrasive media or solvents.

Caution

Never use the door as a handle.

5.4 Eluent

5.4.1 Production

The chemicals used for the production of eluents should have a degree of purity of at least "p.a.". Only ultrapure water (resistance > 18.2 MΩ*cm) may be used for dilution (this generally applies for reagents which are used in ion chromatography).

Newly produced eluents should always be microfiltered (filter 0.45 µm).

The composition of the eluent has a crucial effect on the chromatographic analysis:

Concentration An increase in the concentration generally leads to shorter retention times and faster separation, but also to higher background conductivity signal.

pH pH changes result in shifts in the dissociation equilibria and hence changes in the retention times.

Organic solvents The addition of an organic solvent (e.g. methanol, acetone, acetonitrile) to aqueous eluents generally accelerates lipophilic ions.

5.4.2 Operation

5.4.2.1 Supply bottle

The supply bottle with the eluent must be connected as indicated in *chapter 3.8.1, page 21*. This is above all important for eluents with volatile solvents (e.g. acetone).

Moreover, condensation must also be prevented in the eluent bottle. Drop formation can change the concentration ratio in the eluent.

In the case of very sensitive measurements, we recommend that the eluent be stirred constantly with a magnetic stirrer (e. g. the 2.801.0010 with 6.2070.000).

5.4.2.2 Aspiration filter

To protect the IC system against foreign particles, we recommend aspirating the eluents via a 6.2821.090 aspiration filter *(9-**2**)*. This aspiration filter must be replaced should it show signs of yellow discoloration (but no later than every 3 months).

5.4.2.3 Changing the eluent

When changing the eluent, it must be ensured that no precipitates can occur. Solutions following one another in direct succession must therefore be miscible. If the system has to be rinsed organically, several solvents with rising or falling lipophilia must be used.

5.5 High pressure pump

5.5.1 Protection

Caution

The pump head is filled ex works with methanol/ultrapure water. It must be ensured that the eluent used is freely miscible with the solvent remaining in the pump head.

To protect the high pressure pump against **foreign particles**, we recommend that the eluent undergoes a **microfiltration** (filter 0.45 µm) before being aspirated via a 6.2821.090 aspiration filter *(see Chapter 5.4.2.2, page 45)*.

Salt crystals between the piston and seal cause abrasion particles which can find their way into the eluent. These lead to contaminated valves, a rise in pressure and in extreme cases scratched pistons. It is therefore essential to ensure that **no precipitates** can occur *(see Chapter 5.4.2.3, page 45)*.

Caution

In order to spare the pump seals, the pump should not be operated dry. Therefore ensure that the eluent supply is correctly connected and that there is enough eluent in the eluent bottle each time before switching on the pump.

5.5.2 Maintenance

Caution

Maintenance work on the high pressure pump may not be carried out unless the **instrument is switched off**.

Pump head maintenance

An unstable baseline (pulsation, flow fluctuations) is in many cases the result of contaminated valves *(26-**2**)*, *(26-**3**)* or defective, leaking piston seals on the high pressure pump. Proceed as follows for cleaning contaminated valves and/or replacing worn parts such as pistons, piston seal and valves:

This maintenance work should be carried out at least once a year.

Removing the pump head

1. Switch off high pressure pump and wait until pressure is released.
2. Loosen the pressure screw on the inlet valve holder *(13-**6**)* and unscrew the pump head input capillary *(13-**7**)*, the coupling *(13-**9**)*, and the eluent aspiration tubing from the pump head.

   In the process, eluent will spill. Hold the eluent aspiration tubing up high and allow the eluent to flow back into the eluent bottle.
3. Unscrew the pump head outlet capillary *(13-**13**)* from the pump head.
4. Remove pump head from the pump housing by loosening the 4 fastening screws *(13-**5**)* using the hexagon key (6.2621.030). The main piston is on the left (viewed from the front), and the auxiliary piston is on the right.

Cleaning/replacing the zirconium oxide piston

Clean one piston after the other as follows:

1 Removing the piston cartridge from the pump head

Loosen the piston cartridge with a wrench and unscrew from the pump head by hand.

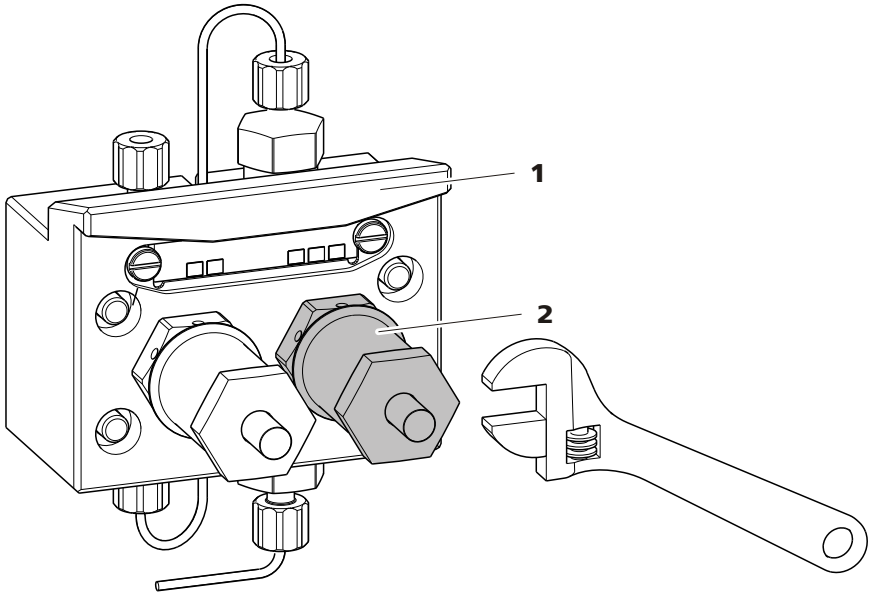

Figure 20 Pump head – removing the piston

1 Pump head	**2 Piston cartridge**

2 Dismantling the piston

Caution

On the inside of the piston cartridge there is a taut spring than can jump out of the piston cartridge if suddenly loosing tension.

When opening the piston cartridge, hold pressure towards the spring and unscrew carefully.

- Loosen the screw of the piston cartridge with a wrench and unscrew carefully by hand and by holding pressure towards the taut spring.
- Remove the zirconium oxide piston and lay on a tissue.
- Remove the spring retainer, spring and the inner plastic sleeve from the piston cartridge and lay by.

- Remove the backup ring from the pump head and lay to the other parts.

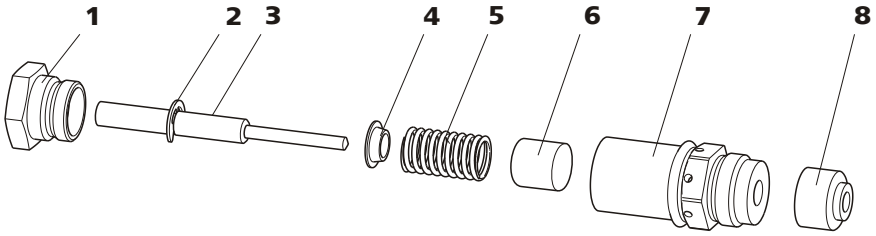

Figure 21 Components of the piston cartridge

1	**Piston cartridge screw**	**2**	**Retaining washer**
3	**Zirconium oxide piston with piston shaft** Order number: 6.2824.070	**4**	**Spring retainer**
5	**Spring** Order number: 6.2824.060	**6**	**Inner plastic sleeve** Protects from metallic abrasion.
7	**Piston cartridge**	**8**	**Backup ring**

3 Cleaning the components of the piston

- Clean zirconium oxide pistons contaminated by abrasion or deposits with fine abrasive cleaning powder, rinse particle free with ultrapure water and dry.
  Replace highly contaminated or scratched zirconium oxide pistons (spare part: 6.2824.070 zirconium oxide piston).
- Rinse the other parts of the piston and dry with a lint-free cloth.

4 Assembling the piston

- Insert the inner plastic sleeve, spring and spring retainer into the piston cartridge.
- Slide the zirconium oxide piston carefully into the piston cartridge until its tip emerges from the small opening of the piston cartridge.
- Attach screw and tighten by hand.

Replacing the piston seal

The special tool (6.2617.010) *(see Figure 22, page 49)* is necessary to remove the piston seal from the pump head. It consists of two parts: a tip

for removing the old piston seal and a sleeve for inserting the new piston seal.

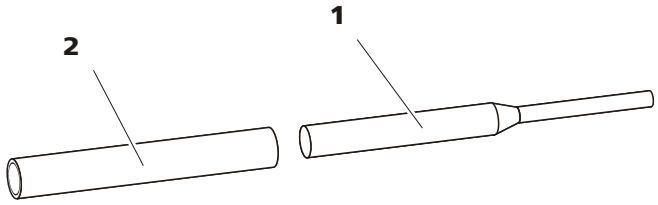

Figure 22 Tool for piston seal

1 Pin
Tip for removing the old piston seal.

2 Sleeve
Sleeve for inserting the new piston seal.

Caution

Screwing the special tool for the piston seal (6.2617.010) into the piston seal destroys this completely!

1 Removing the piston seal

Caution

Avoid touching the sealing surface in the pump head *(13-**4**)* with the tool.

Screw the special tool for the piston seal *(22-**1**)* with the narrow side just as far into the piston seal as the same can be removed.

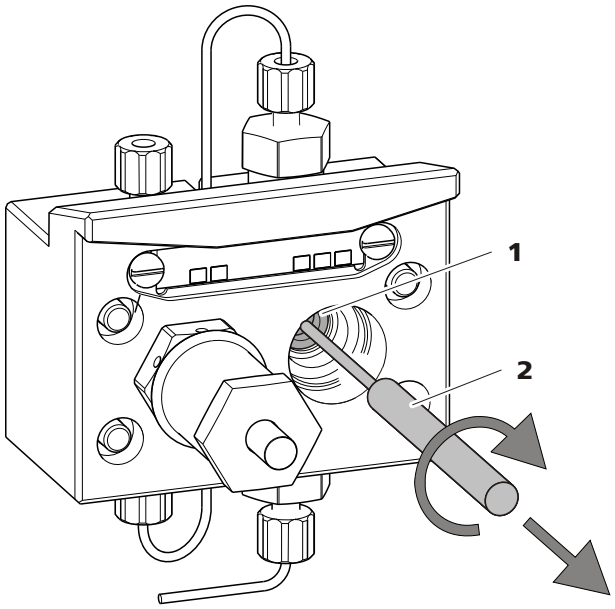

Figure 23 Removing the piston seal

1 Piston seal	**2 Tool for piston seal** Pin of the tool.

2 Inserting the new piston seal into the tool

Insert the new piston seal tightly by hand into the recess of the sleeve of the tool for the piston seal *(22-**2**)*. The sealing springs must be visible from the outside.

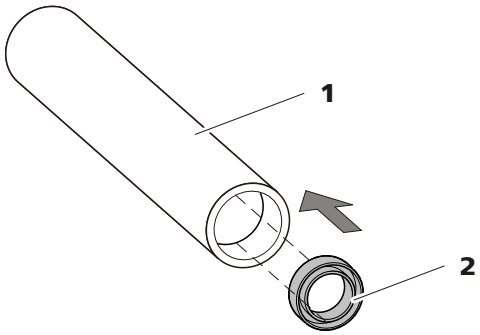

Figure 24 Inserting the piston seal into the tool

1 Tool for piston seal (6.2617.010) Sleeve for inserting the new piston seal.	**2 Piston seal** Order number: 6.2741.020

3 Inserting the new piston seal into the pump head

Guide the sleeve of the tool for the piston seal *(22-**2**)* with inserted piston seal into the pump head and press the seal with the wide end of the tool for the piston seal *(22-**1**)* into the pump head recess.

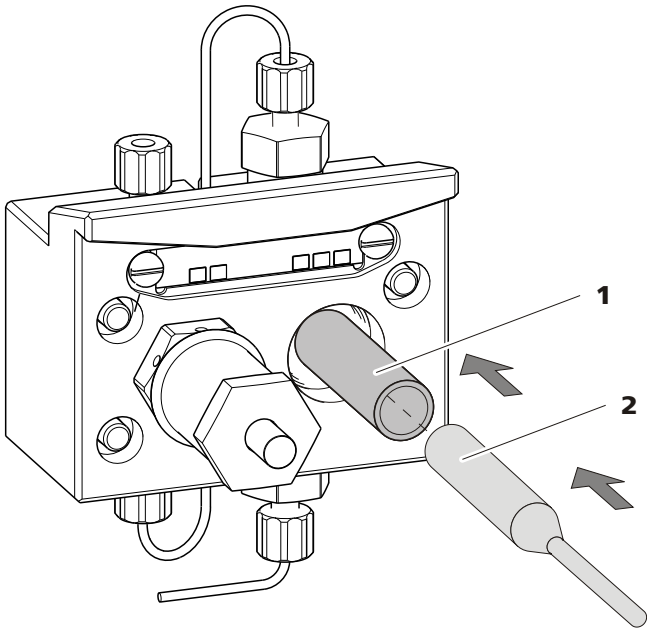

Figure 25 Inserting the piston seal into the pump head

4 Replacing the piston cartridge

Screw the assembled piston cartridge back into the pump head and tighten, first by hand, then additionally by approx. 15° with a wrench.

Cleaning the inlet valve and outlet valve

1 Removing valves

- Unscrew the connection capillary for the auxiliary piston *(13-**1**)* from the outlet valve holder.
- Unscrew the holders for the inlet and outlet valves and remove the valves *(26-**3**)* and *(26-**2**)*.

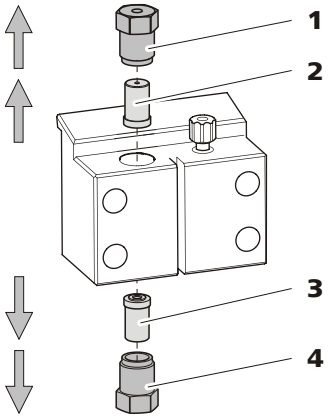

Figure 26 Removing valves

1 **Outlet valve holder**	**2** **Outlet valve** Order number: 6.2824.160
3 **Inlet valve** Order number: 6.2824.170	**4** **Inlet valve holder**

2 Cleaning undissected valve

Clean contaminated or blocked valves initially **without** dismantling them completely.

- Rinse the valve in eluent flow and counterflow direction using a spray bottle filled with ultrapure water, RBS solution or acetone.
- The rinsing effect is further increased through a short treatment (lasting for a maximum of 20 s) in an ultrasonic bath.

Note

Longer lasting ultrasonic baths can damage the ruby ball of the valve.

Only if this cleaning is useless, dismantle the valves separately and clean the components.

3 Dismantling valve

Dismantle every valve separately.

Note

For dismantling the valve the tool for valve cartridges (6.2617.020) is required.

- Place the valve with the seal faced downwards above the recess in the holder.
- Push the valve components out of the valve housing using the needle of the tool.

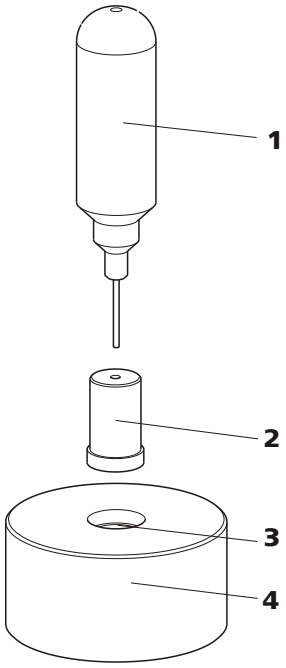

Figure 27 Dismantling valve

1 Needle For pushing the valve components out of the valve housing.	**2 valve**
3 Recess For collecting the valve components.	**4 Holder**

The components of the valve are collected in the recess of the holder.

Note

The components of the valve are very small. In order not to lose them, put the components into a dish.

- The inlet valve and the outlet valve consist of the same, just differently arranged components *(see Figure 28, page 54)*.

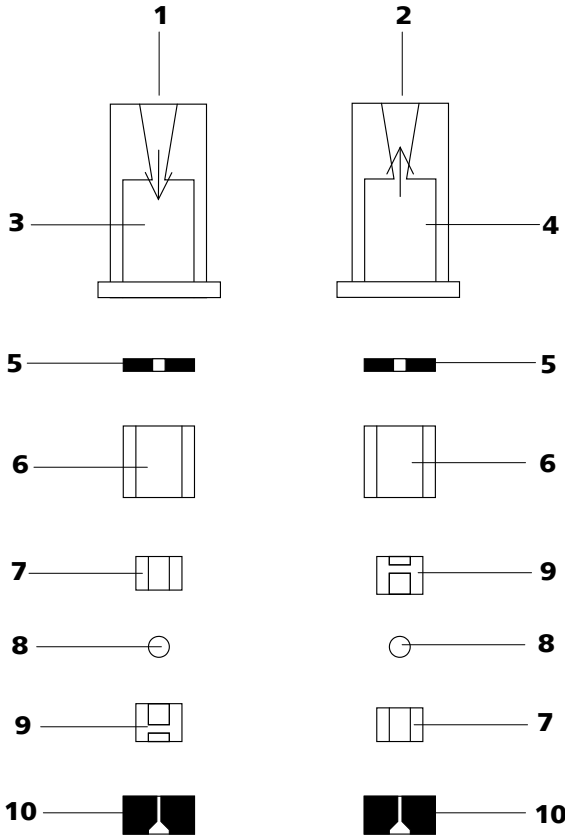

Figure 28 Components of the inlet valve and outlet valve

1	**Inlet valve (6.2824.170)**	**2**	**Outlet valve (6.2824.160)**
3	**Inlet valve housing**	**4**	**Outlet valve housing**
5	**Sealing ring (black)**	**6**	**Sleeve**
7	**Sapphire sleeve** The shiny side must point to ruby ball.	**8**	**Ruby ball**
9	**Ceramic holder for ruby ball**	**10**	**Seal** The larger opening must point outwards.

4 Cleaning the components of the valve

Rinse the valve components with ultrapure water and/or acetone and dry with a lint-free cloth.

5 Reassembling the valve

Reassemble valve components *according to figure 28, page 54*.

- Insert the seal with the larger opening faced downwards into the recess of the tool.
- Lay the other valve components above another in the correct sequence *(see Figure 28, page 54)*.

- Place over the valve housing and hold it tightly.
- By tilting the tool, the valve components slide into the valve housing.
- Press the seal by hand well on the valve housing.

6 Checking the flow direction

Rinse the valve in the direction of the arrow on the valve housing and check wether liquid is escaping on the other end.

If this is not the case, the valve has to be dismantled again and be reassembled correctly *(see Figure 28, page 54)*.

7 Inserting the valves back into the pump head

Caution

If by mistake, the inlet valve is mounted instead of the outlet valve, an extreme pressure builds up within the working cylinder, which can destroy the piston seal!

When inserting the valves, please take into account that the liquid is being pumped through the pump head from bottom to top.

- Insert the inlet valve into the inlet valve holder the way the seal is visible.
- Screw the inlet valve holder into the bottom of the pump head and tighten with a wrench *(26-**4**)*.
- Insert the outlet valve into the outlet valve holder the way the seal is visible.
- Screw the outlet valve holder into the top of the pump head and tighten with a wrench *(26-**1**)*.

Mounting the pump head

Note

To prevent the pump head from being positioned the wrong way, it is provided with different bore hole depths for the fastening bolts, i. e. a fastening bolt is longer than all others. The bore hole with the greatest depth must therefore be assigned to the longest bolt. If this is not the case, the pump will not function perfectly.

1 Mount the pump head on the pump again using the four fastening screws *(13-**5**)*. Firmly tighten the screws with the hexagon key (6.2621.030).

2 Screw connection capillaries *(13-**1**)*, *(13-**7**)* and *(13-**13**)* onto the pump head again.

5.6 Inline filter

5.6.1 Maintenance

The inline filter (6.2821.120) comprises the filter housing *(29-**2**)*, the filter screw *(29-**4**)* and the filter *(29-**3**)*. New filters *(29-**3**)* are available under the order number 6.2821.130 (10 items).

The filters (6.2821.130) *(29-**3**)* should be changed every 3 months (more frequently at higher backpressure).

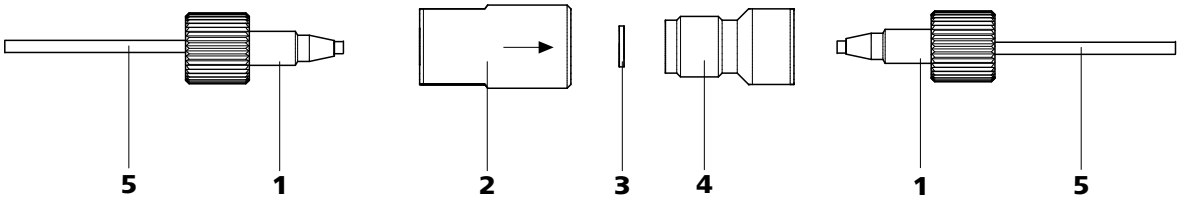

Figure 29 Change filters (of the inline filter)

1 PEEK pressure screws, short (6.2744.070)	**2 Filter housing** Housing of the inline filter. Part of the 6.2821.120 accessories.
3 Filter (6.2821.130) Packaging contains 10 items.	**4 Filter housing** Screw of the inline filter. Part of the 6.2821.120 accessories.
5 Connection capillaries	

Changing the filter

The flow must be stopped before changing the filter.

1 Removing the inline filter

- Unscrew the pressure screws *(29-**1**)* from the inline filter.

2 Unscrewing the filter screw

- Screw the filter screw *(29-**4**)* out of the filter housing *(29-**2**)* with the aid of two adjustable wrenches (6.2621.000).

3 Inserting the filter

- Remove the old filter *(29-**3**)* using tweezers.
- Place the new filter *(29-**3**)* flat in the filter housing *(29-**2**)* using tweezers.

4 Mounting filter screw

- Screw the filter screw *(29-**4**)* back into the filter housing *(29-**2**)* and tighten by hand. Then additionally tighten slightly with two adjustable wrenches (6.2621.000).

5 Remounting the inline filter

- Screw pressure screws *(29-**1**)* back onto the inline filter.

6 Rinsing the inline filter

- Dismantle the guard column (if present) and the separation column and replace with a coupling (6.2744.040).
- Rinse the instrument with eluent.

5.7 Injection valve

5.7.1 Protection

To prevent contamination of the injection valve, a 6.2821.120 inline filter *(see Chapter 3.10, page 29)* should be mounted between the high pressure pump and the pulsation damper.

5.8 Inline sample preparation

To protect the separation column *(see Chapter 3.15, page 37)* against foreign particles which can affect the separating efficiency, we recommend that all samples undergo a microfiltration (filter 0.45 µm). The ultrafiltration cell can be used for **filtration** (see manual of the *IC Equipment for Ultrafiltration*).

Matrix-loaded samples (e.g. blood, oil) should be prepared for the measurement by means of dialysis (see manual on the *IC Equipment for Dialysis*).

If the concentration of the sample is too high, the sample should be **diluted** before feeding (see documentation on the *IC Equipment for Sample Dilution*).

For an overview of all Metrohm inline sample preparation methods go to the following website:*http://misp.metrohm.com*

5.9 Rinsing the sample path

Before a new sample can be measured, the sample path must be rinsed with it so that the measuring result is not falsified by the previous sample (**Sample carry-over**).

In the case of automated sample feeding, the rinsing time should be at least 3 times the **transfer time**.

The transfer time is the time required by the sample to flow from the sample vessel to the end of the sample loop. ##NO_MATCH##.

Ascertaining the transfer time

To ascertain the transfer time, proceed as follows:

1 Emptying the sample path

Pump air through the sample path (pump tubing, tubing connections, sample loop) for several minutes until all liquid is displaced by the air.

2 Aspirating the sample and measuring time

Aspirate a sample typical for the later application and use a stop watch to measure the time required by the sample to travel from the sample vessel to the end of the sample loop.

The time measured corresponds to the "transfer time". The rinsing time should be at least 3 times the transfer time.

Checking the rinsing time

It is possible to determine whether the rinsing time is adequate via a direct measurement of the sample carry-over. Proceed as follows:

1 Preparing two samples

- **Sample A**: A typical sample for the application.
- **Sample sample B**: Ultrapure water.

2 Determining "Sample A"

Let "Sample A" pass through the sample path for the duration of the rinsing time, then inject and measure.

3 Determining "Sample B"

Let "Sample B" pass through the sample path for the duration of the rinsing time, then inject and measure.

4 Calculating the sample carry-over

The degree of the sample carry-over corresponds to the ratio of the peak areas of the measurement for sample B to the measurement for sample A. The lower the ratio, the lower the sample carry-over. This ratio can be modified by varying the rinsing time – thus allowing the rinsing time required for the application to be ascertained.

5.10 Separation column

5.10.1 Separating efficiency

Which analysis quality can be attained, depends to a great extent on the separating efficiency of the separation column used. The separating efficiency of the selected separation column must be sufficient for the analysis problems present. If difficulties occur, you should always first check the quality of the separation column by recording a standard chromatogram.

You can find detailed information on the separation columns available from Metrohm in the leaflet provided along with your separation column, in the **Metrohm IC-Column Program** (available via your Metrohm agent) or in the Internet at *http://www.metrohm.com* in the product area Ion chromatography. You can request free information on special IC applications in the corresponding "**Application Bulletins**" or "**Application Notes**", which are available in the Internet at *http://www.metrohm.com* in the Applications area or via the Metrohm agent responsible.

5.10.2 Protection

To protect the separation column against foreign particles, which can affect the separating efficiency, we recommend that both the eluent and the samples undergo a microfiltration (filter 0.45 µm) before being aspirated via the aspiration filter (6.2821.090).

We recommend always to use a guard column *(see Chapter 3.14, page 35)*. This protects the separation column and considerably increases its service life. Information regarding which guard column is suitable for your separation column can be found in the **Metrohm IC Column Program** (which is available from your Metrohm agent), the leaflet provided along with your separation column, the product information on the separation column at *http://www.metrohm.com* (product area Ion Chromatography) or obtained directly from your agent.

The pulsation absorber *(see Chapter 3.11, page 30)* must be installed in order to protect the column material from pressure concussion caused by injection.

5.10.3 Storage

Always store the separation columns sealed and filled according to the data of the column manufacturer when not using them.

5.10.4 Regeneration

Note

The regeneration is considered as the last measure, and not to be carried out regularly.

If the separating properties of the column have deteriorated, the column can be regenerated according to the specifications of the column manufacturer. In the case of separation columns available from Metrohm, the specification for regeneration can be found on the leaflet provided along with each column.

5.11 Quality Management and validation with Metrohm

Quality Management

Metrohm offers you comprehensive support in implementing quality management measures for instruments and software. Further information on this can be found in the brochure **«Quality Management with Metrohm»** available from your local Metrohm agent.

Validation

Please contact your local Metrohm agent for support in validating instruments and software. Here you can also obtain validation documentation to provide help for carrying out the **Installation Qualification** (IQ) and the **Operational Qualification** (OQ). IQ and OQ are also offered as a service by the Metrohm agents. In addition, various application bulletins are also available on the subject, which also contain **Standard Operating Procedures** (SOP) for testing analytical measuring instruments for reproducibility and correctness.

Maintenance

Electronic and mechanical functional groups in Metrohm instruments can and should be checked as part of regular maintenance by specialist personnel from Metrohm. Please ask your local Metrohm agent regarding the precise terms and conditions involved in concluding a corresponding maintenance agreement.

Note

You can find information on the subjects of quality management, validation and maintenance as well as an overview of the documents currently available at *www.metrohm.com/com/* under **Support**.

6 Troubleshooting

6.1 Problems and their solutions

Problem	Cause	Remedy
Marked drop in pressure	*Leak in the system.*	Check all capillary connections and seal leaks, if necessary *(see Chapter 3.5, page 13)*.
Marked rise in pressure	*Inline filter (6.2821.120) blocked.*	Replace the filter (6.2821.130) *(see Chapter 5.6, page 56)*.
	Guard column – blocked.	Replace guard column *(see Chapter 3.14, page 35)*.
	Separation column – blocked.	▪ Regenerate separation column *(see Chapter 5.10.4, page 61)*. ▪ Replace separation column *(see "Connecting and rinsing the separation column", page 38)*. Note: Samples should always be microfiltered *(see Chapter 5.8, page 58)*.
	Injection valve – valve blocked.	Have the valve cleaned (by Metrohm service technicians).
Drift of the baseline	*Leak in the system.*	Check all capillary connections and seal leaks, if necessary *(see Chapter 3.5, page 13)*.
	Eluent – Evaporation of the organic solvent in the eluent.	▪ Check the eluent bottle attachment *(see Figure 10, page 22)*. ▪ Stir the eluent.
Peak areas lower than expected	*Sample – leak in the sample path.*	Check the sample path.
	Sample – blockage in the sample path.	Check the sample path.
	Sample – sample loop not (completely) filled.	Prolong the sample transfer time.
Very noisy baseline	*High pressure pump – contaminated pump valves.*	Clean pump valves *(see Chapter 5.5.2, page 46)*.
	Eluent – Leak in the eluent path.	Check the eluent path.

Problem	Cause	Remedy
	Eluent – Blockage in the eluent path.	Check the eluent path.
	High pressure pump – defective piston seals.	Replace *(see Chapter 5.5.2, page 46)* piston seals .
	Pulsation absorber not connected.	Connect pulsation absorber *(see Chapter 3.11, page 30)*.
	Pulsation absorber not connected. or defective.	Connect pulsation absorber *(see Chapter 3.11, page 30)*. or replace it.
Background conductivity too high	*Incorrect eluent.*	Change the eluent *(see Chapter 5.4.2.3, Page 45)*.
Data of the separation column cannot be read.	*Column chip contaminated.*	Clean the contact surfaces of the column chip (with alcohol).
	Column chip defective.	1. Save column configuration in MagIC Net™. 2. Notify Metrohm Service.
Individual peaks greater than expected	*Sample – carry-over of the samples from previous measurement.*	Rinse system longer between two samples.
Poor reproducibility of the retention times	*Eluent – Leak in the eluent path.*	Check the eluent path.
	Eluent – Blockage in the eluent path.	Check the eluent path.
	Eluent – Gas bubbles in the eluent.	▪ Deaerate the high pressure pump *(see Chapter 3.9.2, page 27)*.
Chromatograms have poor resolution	*Separation column – diminished separating efficiency.*	▪ Regenerate separation column *(see Chapter 5.10.4, page 61)*. ▪ Replace separation column *(see "Connecting and rinsing the separation column", page 38)*.
Extreme spread of the peaks in the chromatogram. Splitting (dual peaks)	*Capillary connections – dead volume in the system.*	Check connections *(see Chapter 3.5, page 13)* (use PEEK capillaries with an internal diameter of 0.25 mm between the injection valve and detector).
	Guard column – diminished performance.	▪ Replace guard column *(see Chapter 3.14, page 35)*.

Problem	Cause	Remedy
	Separation column – dead volume at column head.	▪ Install the separation column in reverse flow direction (if permitted by the leaflet) and rinse into a beaker. ▪ Replace separation column *(see "Connecting and rinsing the separation column", page 38)*.
Precision problems - significant scattering of the measured values	*Injection valve – sample loop.*	Check installation of the sample loop *(see Chapter 3.12.1, page 31)*.
	Sample – rinsing volume too low.	Increase rinsing time *(see Chapter 5.9, page 58)*.
	Injection valve – defective.	Request Metrohm Service.
Unexpected change to the retention times in the chromatograms	*Separation column – diminished separating efficiency.*	▪ Regenerate separation column *(see Chapter 5.10.4, page 61)*. ▪ Replace separation column *(see "Connecting and rinsing the separation column", page 38)*.
	High pressure pump – defective.	Request Metrohm Service.

7 Technical specifications

7.1 Reference conditions

The technical data listed in this Chapter refers to the following reference conditions:

Ambient temperature	+25 °C (± 3 °C)
Instrument status	> 40 minutes in operation (equilibrated)

7.2 Instrument

IC system	▪ Metal-free IC system ▪ Compact system with modular design
Material	Painted polyurethane hard foam without CFCs, fire class V0
Operating pressure range	▪ 0…50 MPa (500 bar) high pressure pump ▪ 0…35 MPa (350 bar) standard-PEEK system
Intelligent components	iPump, iDetector, iColumn, intelligent Dosino, MagIC Net

7.3 Leak sensor

Type	Electronic, no calibration necessary

7.4 Ambient conditions

Operation	
Ambient temperature	+5…+45 °C
Humidity	20…80 % relative humidity
Storage	
Ambient temperature	–20…+70 °C
Transport	
Ambient temperature	–40…+70 °C

7.5 Housing

Dimensions	
Width	302 mm
Height	562 mm
Depth	368 mm
Material of base tray, housing and covering plate	Polyurethane hard foam (PUR) with flame retardation for fire class UL94V0, CFC-free, coated
Operating elements	
Indicators	LED for power display
On/Off switch	On the rear panel of the instrument

7.6 High pressure pump

Type

- Serial dual-piston pump
- Intelligent pump head recognition
- Chemically inert
- Metal-free pump heads
- Materials in contact with eluent: PEEK, ZrO_2, PTFE/PE
- Self-optimizing flow and pressure

Flow rate	
Adjustable flow range	0.001…20.0 mL/min
Flow increment	1 µL/min
Reproducibility of the eluent flow	< 0.1 % deviation
Pressure range	
Pump	0…50.0 MPa (0…500 bar)
Pump head	0…35.0 MPa (0…350 bar) (applies for the standard PEEK pump head)
Residual pulsation	< 1 %
Safety shutdown	
Function	Automatic shutdown upon reaching the pressure limit values
Maximum pressure limit	▪ Adjustable from 0.1…50 MPa (1…500 bar)

- The pump is automatically shut down at the first piston stroke above the maximum limit value

Minimum pressure limit

- Adjustable from 0…49 MPa (0…490 bar)
- The shutdown mechanism is inactive at 0 MPa
- The shutdown mechanism only becomes active 2 minutes after system start
- The pump is automatically shut down after 3 piston strokes below the minimum pressure limit

7.7 Injection valve

Actuator time	typ.100 ms
Max. operating pressure	35 MPa (350 bar)
Material	PEEK

7.8 Mains connection

Required voltage	100…240 V ± 10 % (auto-sensing)
Required frequency	50…60 Hz ± 3 (auto-sensing)
Power consumption	▪ 65 W for typical analysis application ▪ 25 W standby (conductivity detector to 40 °C)
Power supply unit	▪ Up to 300 W maximum, electronically monitored ▪ internal fuse 3.15 A

7.9 Interfaces

USB

Input	1 USB upstream, type B (for connection to the PC)
Output	2 USB downstream, type A

MSB 2 MSB MiniDin 8-pin (female) (for Dosino, stirrer, remote lines, …)

Caution

When connecting an instrument to the MSB connector you **must** switch off the 882 Compact IC plus.

Detector 1 DSUB-15-pin high density (female)

Column recognition	for an intelligent column
Leak sensor	1 jack plug
Further connections	
Auxiliary	1 DSUB 15-pin (female)
Service	1 DSUB 15-pin (female)

7.10 Safety specification

Design / Test

- EN/IEC 61010-1
- UL 61010-1
- CSA-C22.2 No. 61010-1
- Protection class I

7.11 Electromagnetic compatibility (EMC)

Emission

- EN/IEC 61326-1
- EN/IEC 61000-6-3
- EN 55022 / CISPR 22
- EN/IEC 61000-3-2
- EN/IEC 61000-3-3

Immunity

- EN/IEC 61326-1
- EN/IEC 61000-6-2
- EN/IEC 61000-4-2
- EN/IEC 61000-4-3
- EN/IEC 61000-4-4
- EN/IEC 61000-4-5
- EN/IEC 61000-4-6
- EN/IEC 61000-4-8
- EN/IEC 61000-4-11
- EN/IEC 61000-4-14
- NAMUR

7.12 Weight

Weight 17.1 kg (without accessories)

8 Conformity and warranty

8.1 Declaration of Conformity

This is to certify the conformity to the standard specifications for electrical appliances and accessories, as well as to the standard specifications for security and to system validation issued by the manufacturing company.

Name of commodity

882 Compact IC plus

The 882 Compact IC plus is an intelligent ion chromatograph in a compact design for the determination of anions, cations or polar substances.

This instrument has been built and has undergone final type testing according to the standards:

Electromagnetic compatibility

Emission:	EN/IEC 61326-1: 2006, EN/IEC 61000-6-3: 2004, EN 55022 / CISPR 22: 2006, EN/IEC 61000-3-2: 2006, EN/IEC 61000-3-3: 2005
Immunity:	EN/IEC 61326-1: 2006, EN/IEC 61000-6-2: 2005, EN/IEC 61000-4-2: 2001, EN/IEC 61000-4-3: 2002, EN/IEC 61000-4-4: 2004, EN/IEC 61000-4-5: 2001, EN/IEC 61000-4-6: 2001, EN/IEC 61000-4-8: 2001, EN/IEC 61000-4-11: 2004, EN/IEC 61000-4-14: 2004, NAMUR: 2004

Safety specifications

EN/IEC 61010-1: 2001, UL 61010-1: 2004,
CSA-C22.2 No. 61010-1: 2004, protection class I

CE

This instrument meets the requirements of the CE mark as contained in the EU directives 2006/95/EC (LVD), 2004/108/EC (EMC). It fulfils the following specifications:

EN 61326-1	Electrical equipment for measurement, control and laboratory use – EMC requirements
EN 61010-1	Safety requirements for electrical equipment for measurement, control and laboratory use

This instrument meets the requirements of the ETL Listed Mark for the North American market. It conforms to the electrical safety standards UL 61010-1 and CSA-C22.2 No. 61010-1. This product is listed in Intertek's Directory of Listed Products.

Manufacturer Metrohm Ltd., CH-9101 Herisau/Switzerland

Metrohm Ltd. is holder of the SQS-certificate ISO 9001:2000 Quality management system for development, production and sales of instruments and accessories for ion analysis.

Herisau, 27 October, 2008

D. Strohm
Vice President, Head of R&D

Ch. Buchmann
Vice President, Head of Production
Responsible for Quality Assurance

8.2 Quality Management Principles

Metrohm Ltd. holds the ISO 9001:2000 Certificate, registration number 10872-02, issued by SQS (Swiss Association for Quality and Management Systems). Internal and external audits are carried out periodically to assure that the standards defined by Metrohm's QM Manual are maintained.

The steps involved in the design, manufacture and servicing of instruments are fully documented and the resulting reports are archived for ten years. The development of software for PCs and instruments is also duly documented and the documents and source codes are archived. Both remain the possession of Metrohm. A non-disclosure agreement may be asked to be provided by those requiring access to them.

The implementation of the ISO 9001:2000 quality management system is described in Metrohm's QM Manual, which comprises detailed instructions on the following fields of activity:

Instrument development

The organization of the instrument design, its planning and the intermediate controls are fully documented and traceable. Laboratory testing accompanies all phases of instrument development.

Software development

Software development occurs in terms of the software life cycle. Tests are performed to detect programming errors and to assess the program's functionality in a laboratory environment.

Components

All components used in the Metrohm instruments have to satisfy the quality standards that are defined and implemented for our products. Suppliers of components are audited by Metrohm as the need arises.

Manufacture

The measures put into practice in the production of our instruments guarantee a constant quality standard. Production planning and manufacturing procedures, maintenance of production means and testing of components, intermediate and finished products are prescribed.

Customer support and service

Customer support involves all phases of instrument acquisition and use by the customer, i.e. consulting to define the adequate equipment for the analytical problem at hand, delivery of the equipment, user manuals, training, after-sales service and processing of customer complaints. The Metrohm service organization is equipped to support customers in implementing standards such as GLP, GMP, ISO 900X, in performing Operational Qualification and Performance Verification of the system components or in carrying out the System Validation for the quantitative determination of a substance in a given matrix.

8.3 Warranty (guarantee)

Metrohm guarantees that the deliveries and services it provides are free from material, design or manufacturing errors. The warranty period is 36 months from the day of delivery; for day and night operation it is 18 months. The warranty remains valid on condition that the service is provided by an authorized Metrohm service organization.

Glass breakage is excluded from the warranty for electrodes and other glassware. The warranty for the accuracy corresponds to the technical specifications given in this manual. For components from third parties that make up a considerable part of our instrument, the manufacturer's warranty provisions apply. Warranty claims cannot be pursued if the Customer has not complied with the obligations to make payment on time.

During the warranty period Metrohm undertakes, at its own choice, to either repair at its own premises, free of charge, any instruments that can be shown to be faulty or to replace them. Transport costs are to the Customer's account.

Faults arising from circumstances that are not the responsibility of Metrohm, such as improper storage or improper use, etc. are expressly excluded from the warranty.

9 Accessories

Note

Subject to change without notice!

9.1 Scope of delivery

2.882.0010 882 Compact IC plus – Cation

Qty.	Order no.	Description
1	1.882.0010	**882 Compact IC plus – Cation**
1	6.2122.0x0	**Mains cable with C13 line socket IEC-60320-C13** Cable plug according to customer requirements. Switzerland: Type SEV 12 6.2122.020 Germany, …: Type CEE(7), VII 6.2122.040 USA, …: Type NEMA/ASA 6.2122.070
1	6.1602.160	**Eluent bottle attachment GL 45** For eluent bottles; with connections for adsorber tube and aspiration tubing. Opening ground joint: A-14/15
1	6.1608.070	**Eluent bottle / 2 L / GL 45** Material: Clear glass Height (mm): 262 Volume (mL): 2000

Qty.	Order no.	Description	
1	6.1609.000	**Adsorber tube / large and bent**	

For filling with adsorber material.

Material:	Glass
Height (mm):	129
Inner diameter (mm):	32
SGJ size:	B-14/15

Qty.	Order no.	Description	
1	6.1803.040	**PTFE capillary 0.5 mm i.d. / 1 m**	

Capillary for sample handling in IC.

Material:	PTFE
Outer diameter (inches):	1/16
Inner diameter (mm):	0.5
Length (m):	1

Qty.	Order no.	Description	
1	6.1807.010	**Y connector for tubing i.d. 6-9 mm**	

Connector for waste tubings

Qty.	Order no.	Description	
2	6.1816.020	**Silicone tubing 6 mm i.d. / 1 m** For drainage tubings Material: Silicone rubber Outer diameter (mm): 9 Inner diameter (mm): 6 Length (m): 1	
1	6.2023.020	**Clip for SGJ 14/15** Clip for SGJ 14/15 Material: POM	
1	6.2151.020	**Cable USB A - USB B / 1.8 m** USB connecting cable Length (m): 1.8	
1	6.2251.000	**Colored sleeves for capillaries** Colored pieces of heat shrink tubing for capillary coding. Three pieces each of five different colors.	
1	6.2322.020	**PRIMUS multi cation standard solution: Promo**	

Qty.	Order no.	Description	
1	6.2617.010	**Tool for piston seal** For removing and assembling the piston seal for all standard pump heads	
2	6.2621.000	**Adjustable wrench** Maximum opening: 20 mm. For IC instruments Length (mm): 150	
1	6.2621.030	**Hexagon key 4 mm** Length (mm): 73	
1	6.2621.050	**1/4 in. wrench** For 1/4 in. screws. For IC instruments Length (mm): 73	

Qty.	Order no.	Description
1	6.2621.080	**Capillary cutter** For plastic capillaries. For IC instruments Length (mm): 118
1	6.2621.100	**Hexagon key 3 mm** Hexagon key 3 mm. For IC Sample Processors Length (mm): 73
1	6.2626.000	**Front drain nozzle** Drain nozzle for Professional IC instruments to be mounted on the front of the instrument
2	6.2739.000	**Wrench** For tightening connectors Length (mm): 68

Qty.	Order no.	Description	
1	6.2743.080	**Stoppers for overflow, 5 pieces** For Professional IC instruments	
1	6.2744.014	**Pressure screw 2x** With UNF 10/32 connection. For the connection of PEEK capillaries Material: PEEK Length (mm): 26	
1	6.2744.020	**Luer/UNF coupling** For IC instruments Material: PEEK Length (mm): 19	
1	6.2744.040	**2 x UNF 10/32 coupling** For connecting 1/16 in. capillaries. For IC instruments Material: PEEK Length (mm): 24	

Qty.	Order no.	Description
1	6.2744.070	**Pressure screw short** Short version. With UNF 10/32 connection. 5 pieces. For the connection of PEEK capillaries Material: PEEK Length (mm): 21

Qty.	Order no.	Description
1	6.2744.210	**Tubing adapter for aspiration filter** For Professional IC instruments

Qty.	Order no.	Description
1	6.2816.020	**Syringe 10 mL with Luer connection** For different usage in IC and VA Material: PP Length (mm): 102 Volume (mL): 10

Qty.	Order no.	Description
1	6.2816.040	**Purging needle** With PTFE tubing and Luer connection. For syringes. For aspirating eluents.

Qty.	Order no.	Description	
1	6.2821.090	**Aspiration filter** Pore size 20 µm. Set of 5 pieces. For 6.1834.000 aspiration tubing and 6.1821.040 and 6.1821.050 filter tubes. Material: PE Outer diameter (mm): 9.5 Length (mm): 35.5	
1	6.2821.130	**Spare filter for inline filter** Spare filter for inline filter.	
9.2 Optional accessories

2.882.0010 882 Compact IC plus – Cation

Order no.	Description	
2.850.9010	**850 Professional IC Detector – iDetector** Compact and intelligent High Performance Conductivity Detector for intelligent IC Instruments. Outstanding temperature stability, the complete signal processing within the protected detector block and the latest generation of «DSP» – Digital Signal Processing – guarantee the highest precision for the measurement. No change of measuring ranges – not even automatic – is required due to the dynamic working range.	
6.2617.040	**Tool for piston seal Macro** For removing and assembling the piston seal for Macro pump heads	

Order no.	Description

6.2741.040 **PE/PTFE piston seal Macro**

For all Macro pump heads

6.2824.130 **Macro pump head PEEK**

Macro pump head for intelligent IC instruments, flow range 0.1…20 mL/min, maximum pressure 12.5 MPa.

Material: PEEK (metal-free)

6.5333.000 **IQ/OQ Kit for IC**

The IQ/OQ Kit contains all parts and standard solutions required for IQ/OQ in ion chromatography.

6.6059.221 **MagIC Net™ 2.2 Compact CD: 1 license**

Professional PC program for controlling an intelligent Compact IC systems and an Autosampler or a 771 Compact Interface. The software permits control, data acquisition, evaluation and monitoring as well as report generation of ion chromatographic analyses. Graphics user interface for routine operations, extensive database programs, method development, configuration and manual system control; very flexible user administration, efficient database operations, extensive data export functions, individually configurable report generator, control and monitoring of all system components and the chromatography results.
MagIC Net™ Compact complies fully with FDA Regulation 21 CFR Part 11 as well as GLP. Dialog languages: German, English, French, Spanish, Chinese, Korean, Japanese, et. al. 1 license.

6.6059.222 **MagIC Net™ 2.2 Professional CD : 1 license**

Professional PC program for controlling intelligent Professional IC systems, Compact IC systems and their peripherals such as various Autosamplers, 800 Dosino, 771 Compact Interface, etc. The software permits control, data acquisition, evaluation and monitoring as well as report generation of ion chromatographic analyses. Graphics user interface for routine operations, extensive database programs, method development, configuration and manual system control; very flexible user administration, efficient database operations, extensive data export functions, individually configurable report generator, control and monitoring of

Order no.	Description
	all system components and the chromatography results. MagIC Net™ Professional complies fully with FDA Regulation 21 CFR Part 11 as well as GLP. Dialog languages: German, English, French, Spanish, Chinese, Korean, Japanese, et. al. 1 license.
6.6059.223	**MagIC Net™ 2.2 Multi CD: 3 licenses** Professional PC program for controlling intelligent Professional IC systems, Compact IC systems and their peripherals such as various Autosamplers, 800 Dosino, 771 Compact Interface, etc. The software permits control, data acquisition, evaluation and monitoring as well as report generation of ion chromatographic analyses. Graphics user interface for routine operations, extensive database programs, method development, configuration and manual system control; very flexible user administration, efficient database operations, extensive data export functions, individually configurable report generator, control and monitoring of all system components and the chromatography results. MagIC Net™ Multi complies fully with FDA Regulation 21 CFR Part 11 as well as GLP. Dialog languages: German, English, French, Spanish, Chinese, Korean, Japanese, et. al. Client Server version with 3 licenses.
